HosPRO

HOSPRO.CO.UK · 360° HOTEL MANAGEMENT, CONSULTANCY & TECHNOLOGY

The common-sense hospitality operating system.

What we have built, how it runs a hotel on the ground, how it saves cost and lifts productivity — and what we want to build next with AI: an operational and revenue-management platform for independent hotels, delivered with a joint-venture partner.

OVERVIEW

Executive summary

HosPRO is a working hotel operating platform, built inside a live hotel by people who run hotels. It replaces WhatsApp, printouts and seven disconnected systems with one connected layer that every department uses on their phone — and gives the general manager one live picture of the whole property.

10
connected modules live across the property

2
hotels running on HosPRO (Brandon Hall · The Barn)

1
login, one app, one database — role decides what you see

0
WhatsApp groups needed to run maintenance

What this document covers

14 · Guest data & marketing p.22
15 · The AI vision p.23–24
16 · Guest experience p.25
17 · The joint venture p.26
18 · Roadmap p.27–28
19 · Next steps p.29

The proposition in four lines

Built, not slideware. Housekeeping, maintenance, reception, F&B, fire safety, sales, rota, marketing, P&L and a revenue-management module are live and in daily use.

Operations-first. Every feature exists because a housekeeper, fixer or receptionist needed it on a Tuesday morning. Nothing exists because a vendor roadmap said so.

Measured. Photo proof, timers, costs, approvals and completion loops produce real operating data — the raw material for AI.

Ready for a partner. We bring the hotel domain, the live customer base and the data model. We are looking for a technology partner to take the AI, agent and voice layer to product grade and scale it across the independent-hotel market.

> *"Common sense first, technology second. The system has to make the person on the floor faster, not slower — or it is not a system, it is admin."*

1 · THE OPPORTUNITY

Independent hotels are desperate for three things

Talk to any owner or general manager of an independent hotel and the same three problems come up within five minutes: maintenance that costs too much and takes too long, room rates set blind against the competition, and not enough business through the door — especially meetings, weddings and events. The 2026 industry buyer's guide for hotel management systems confirms the backdrop: systems "buckling under rising acquisition costs, OTA dependence and siloed data", and a market shifting from feature checklists to platforms that act as an *interaction layer* across operations, revenue, marketing and guests.

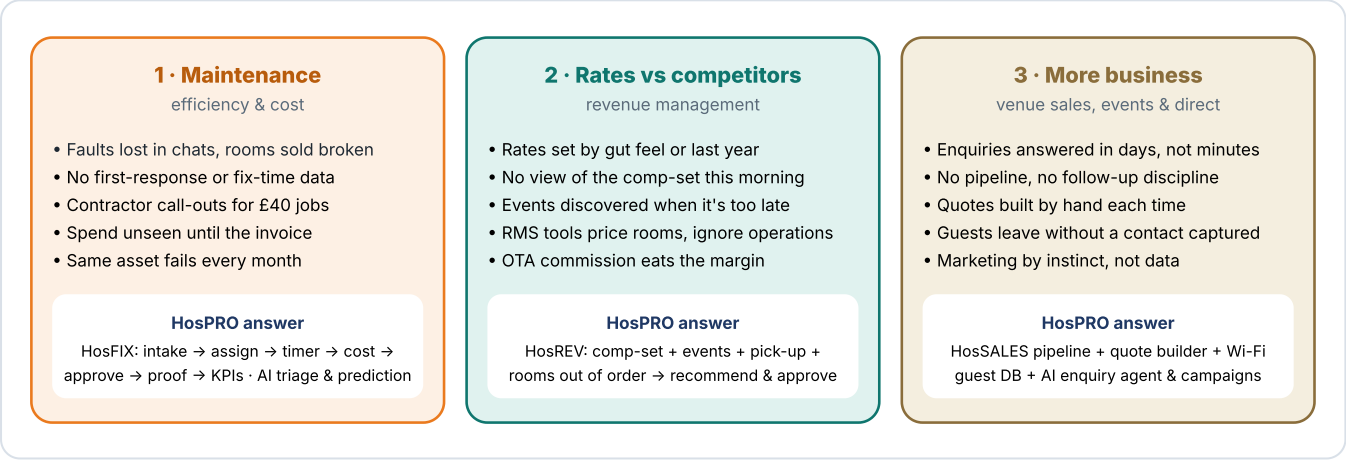

Figure A · The three pains every independent hotel names — and the HosPRO module that answers each

The market

Industry guidance segments the market into large hotels (100–500+ rooms, departmental silos), boutiques and independents (20–100 rooms, high-touch) and B&Bs and small hotels. HosPRO is built for the middle: properties too complex for a diary and too small for an enterprise suite. In the UK alone that is thousands of country-house hotels, inns, spa hotels and wedding venues — and the pattern repeats across Europe and the Gulf.

What buyers now say they want

The buyer's guide lists role-based permissions and audit trails, deep departmental integrations, unified guest profiles, fast onboarding (three weeks for a small property) and — above all — interoperability over isolated features. Independents add: cutting OTA cost, keeping staff agile and avoiding training overhead. Every one of those is a HosPRO design principle already.

Where the incumbents stop

PMS-centred suites (Cloudbeds, Mews, Little Hotelier, RoomRaccoon) run reservations, channels and billing, and are now adding AI on top of booking data. None of them run the back of house: who fixed the shower, how long the room took, whether the fridge was in range, who is on site. That operational layer — and the data it generates — is the gap HosPRO fills and the asset a JV builds on.

Why this, why us, why now

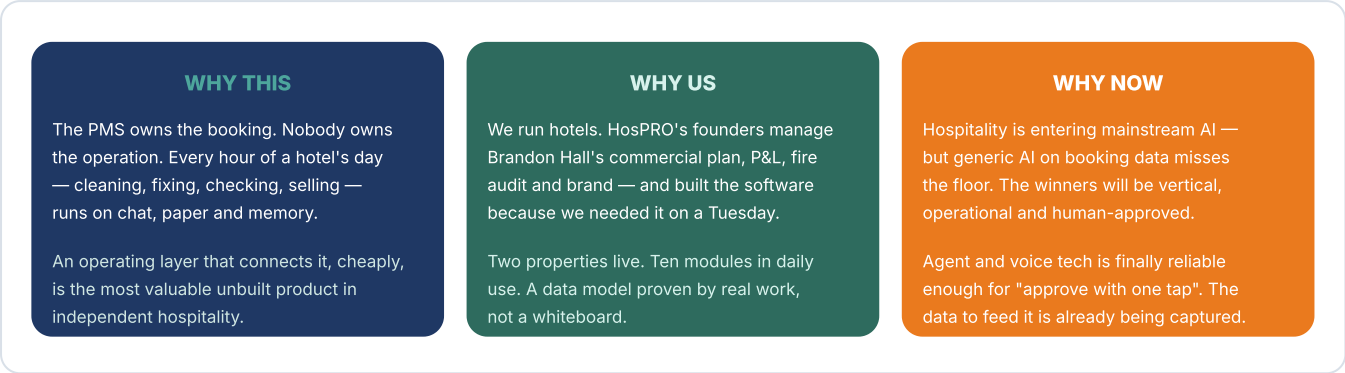

Figure B · The thesis in three panels

What we want to build with a partner

A single, multi-property, AI-driven hospitality operations and revenue platform for independent hotels — sold per property, installed in a day, and measurably paying for itself in maintenance cost, labour, rate and direct-business gains. Concretely, over the next six months:

Maintenance that costs less

AI triage and predictive maintenance on HosFIX; cost per job, first-response and fix-time KPIs; contractor-vs-in-house decisions made on data.

Rates that beat the comp-set

HosREV with live rate-shopper and PMS feeds, event detection, forecasting, explanations and guard-railed auto-approval — and the one thing no RMS has: knowledge of what is happening in the building.

More venue and events business

Minutes-not-days enquiry response with an AI agent, instant configurator quotes, pipeline discipline, and campaigns to a guest database the hotel actually owns.

Guests who feel it

Faults fixed before they are found, requests routed and tracked, a concierge that answers at 2 a.m., and a post-stay loop that brings people back direct.

> *The sequence matters: operations first (adoption and data), revenue second (margin), growth third (top line), intelligence throughout. That is the order a hotel feels the benefit — and the order the roadmap on page 27 follows.*

What we are not trying to be

We are not building a PMS, a channel manager or a booking engine; those exist and integrate well. We are not building a generic chatbot. We are building the operating layer that sits around the PMS and makes every department, and eventually every rate decision, measurably better — then licensing it to the thousands of hotels that look like ours.

3 · THE PROBLEM

How an independent hotel actually runs today

A 120-room hotel with a spa, restaurant and events runs on a patchwork: a property-management system for rooms, a printout for housekeeping, WhatsApp for maintenance, a clipboard for fire checks, spreadsheets for F&B figures, email for sales enquiries and a monthly accountant's pack for the numbers. None of them talk to each other. The glue is people — and the glue breaks every day.

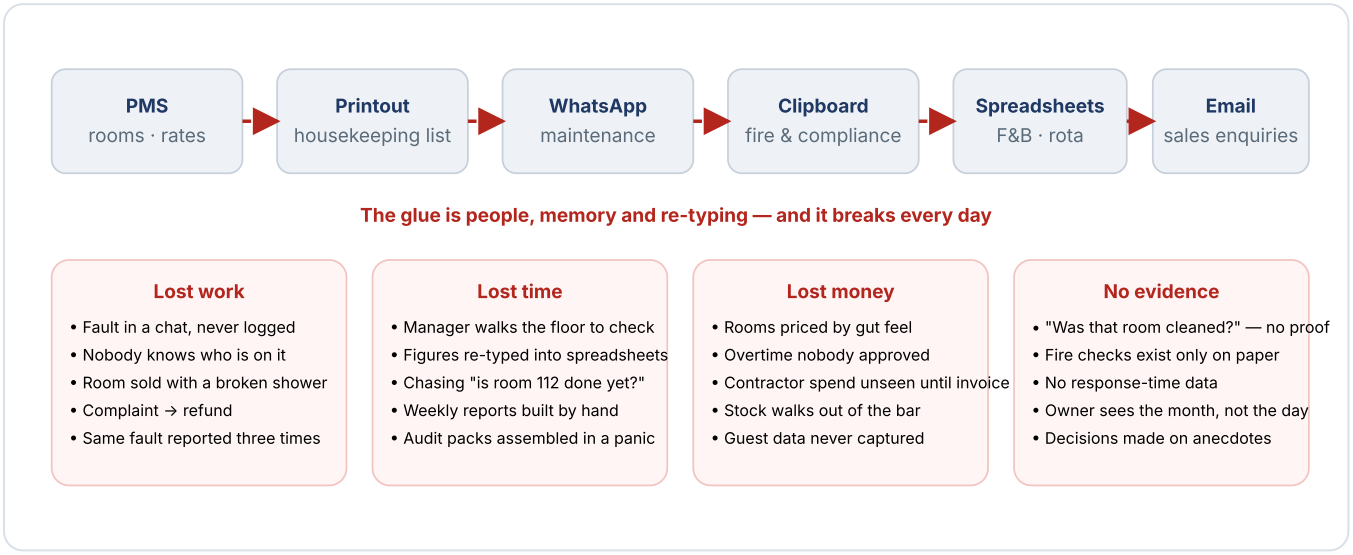

Figure 1 · Six systems, zero connections — the daily reality in most independent hotels

Why the big suites don't fix it

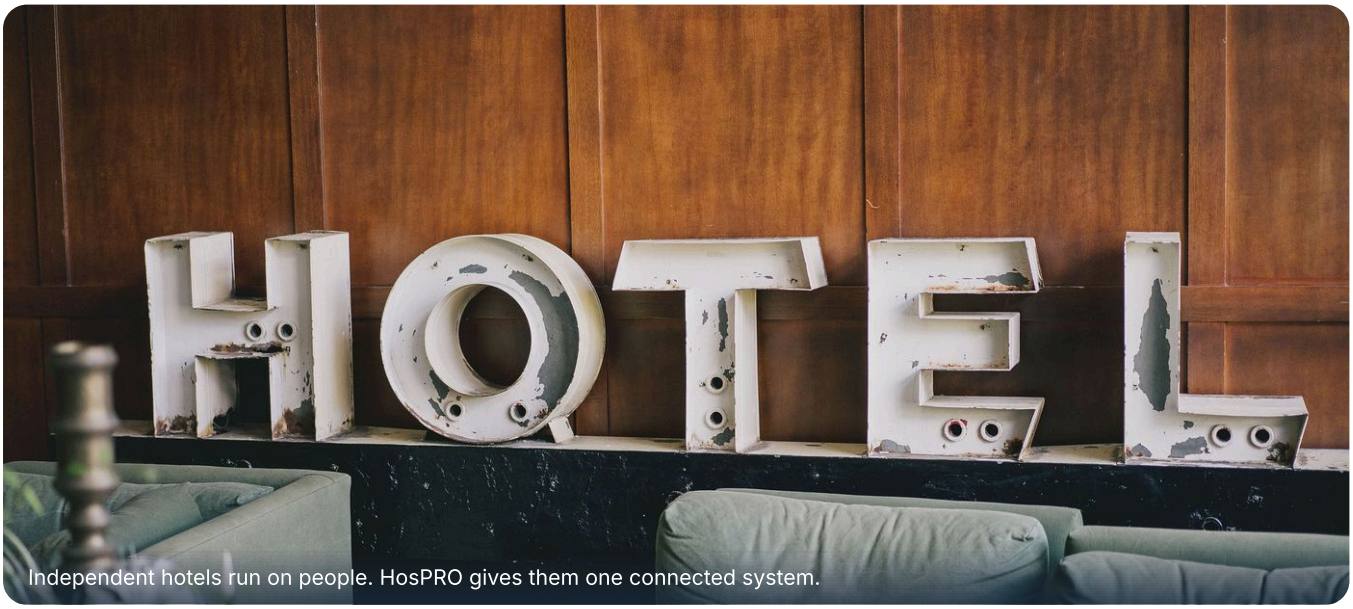

Enterprise hotel software is priced and designed for chains: long implementations, per-module licences, and workflows the hotel must bend to. Independents end up using 20% of it and still run WhatsApp on the side.

Why point apps don't fix it

A maintenance app here, a housekeeping app there — each with its own login, its own data and no idea the other exists. The hand-off between departments is exactly where the value is, and exactly what point apps miss.

What the opportunity is

One connected operating layer, built around how a hotel actually works, cheap enough for a 70-room property, installable on any phone in a day — and generating the operational data that makes AI genuinely useful.

Independent hotels run on people. HosPRO gives them one connected system.

4 · OUR APPROACH

Common-sense systems: the six principles

HosPRO was not designed in a workshop. It was built week by week inside Brandon Hall Hotel & Spa — a 120-bedroom country-house hotel with a spa, restaurant, meetings and weddings — by the people running it. Every principle below is a lesson paid for on the floor.

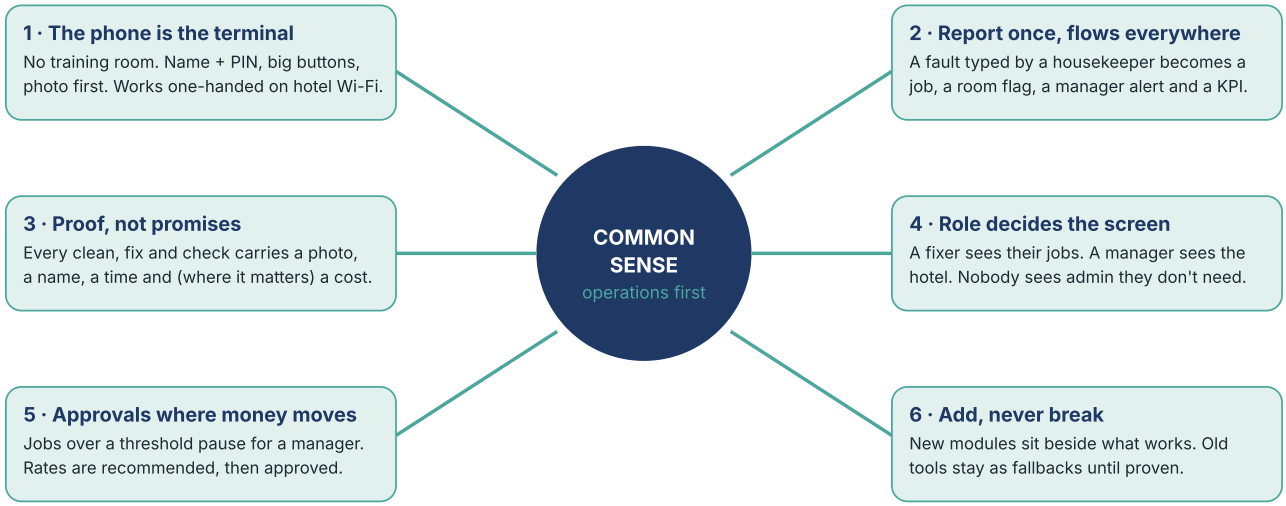

Figure 2 · The six operating principles every HosPRO module is tested against

What "common sense" means in practice

- If a feature takes more taps than WhatsApp, it loses — so it is redesigned until it wins.
- Data is captured as a by-product of the work (a completion photo), never as a separate task ("fill in the log").
- The desktop is for managers and reports; the floor runs on phones.
- Thresholds, defaults and assignments are configured per hotel in minutes, not coded per client.
- Each hotel keeps its own data in its own collections; the platform is shared.

Where this comes from

HosPRO is run by hotel operators and commercial leaders, not a software vendor. The same team manages Brandon Hall's commercial plan, its P&L, its fire audit preparation and its brand — so the software is shaped by owning the outcome, not by selling licences.

That is the asset we bring to a JV: the **domain, the live customers, the data model and the operating know-how**. What we want from a partner is the engineering platform, AI and agent capability to turn it into a product at scale.

5 · THE PLATFORM TODAY

One app, one database, every department

HosPRO Mobile is a single installable web app. A person picks their department, their name and a four-digit PIN and sees only their tiles. Managers land on a live hotel overview. Everything writes to one shared database, so the desktop portal, the phone app and the reports always agree.

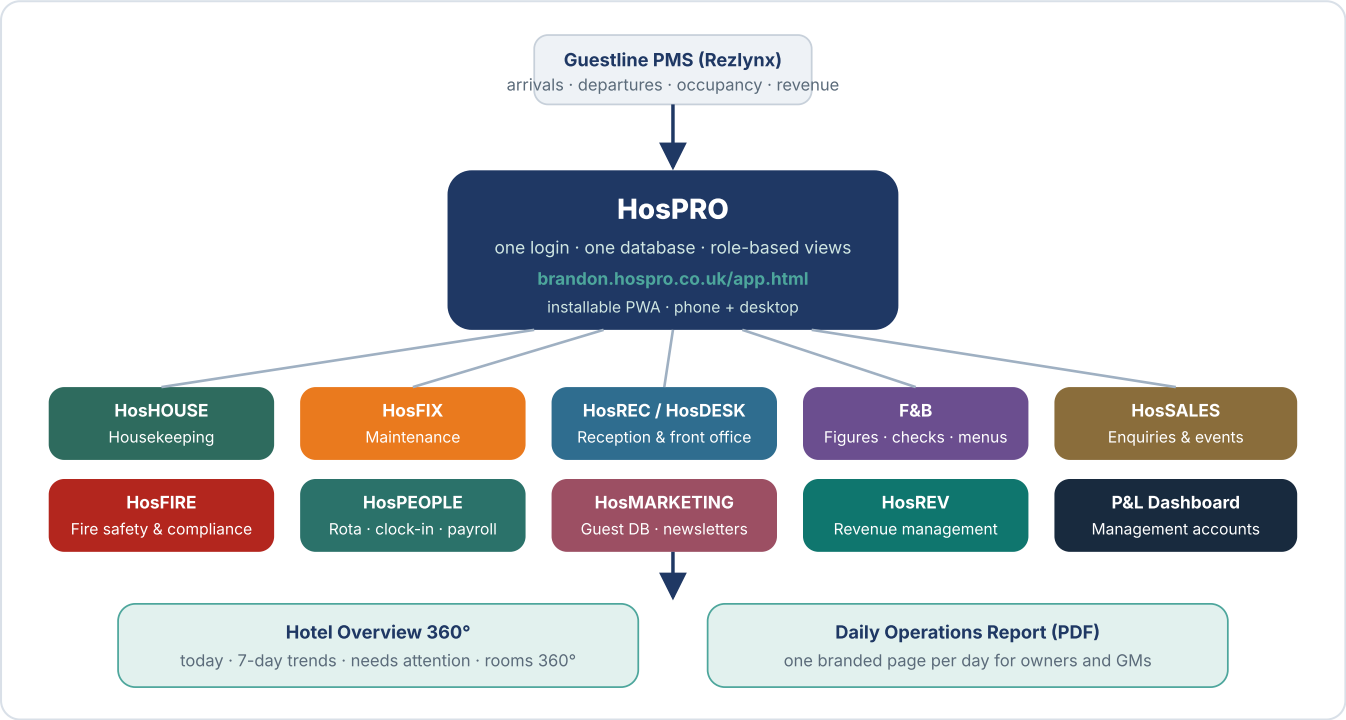

Figure 3 · The HosPRO hub — the PMS feeds it, ten modules run on it, two outputs summarise it

Who uses it

Directors and GM · front office · housekeeping (lead + housekeepers) · maintenance (manager + fixers) · F&B · sales & events · fire marshals. Each has one PIN and one icon on their phone.

How it is installed

Open the link on a phone → Add to Home Screen. No app store, no device management, no per-seat licence. A new department link is live in under a minute.

What it runs on

Vanilla web (PWA) on GitHub Pages, Google Firebase (Firestore, Cloud Functions) and a small Google Cloud VM for the guest Wi-Fi relay. Total hosting cost for a 120-room hotel: tens of pounds a month.

5 · THE PLATFORM TODAY

What is built — module by module

Status as of November 2026. BUILT live and in daily use · PARTIAL live with gaps · PLANNED designed, not yet built · JV proposed scope for the joint venture.

Module	What it does on the ground	Key functions	Status
HosHOUSE Housekeeping	Reception sets the day's rooms; the system allocates by skill, rating and floor; housekeepers work each room on their phone with photo checklists and completion photos; managers watch live progress.	Bulk room picker · auto/manual allocation · start → checklist → photos → sign-off · DND/refused with door photo · voice notes · floor plans · lost property · raise a fault · overview dashboard · room-check history · branded PDF report	BUILT
HosFIX Maintenance	Faults arrive from housekeeping, reception and F&B (never WhatsApp). Jobs default to the fixers; the manager can redeploy. Fixers run each job with a timer, photos, materials and receipts.	Three-tier access (management / reporters / operatives) · priorities · assign & redeploy · timers · before/after photos · materials & receipts · £50 approval gate · cancel/reopen · completion flows back to the room · landscape PDF report · push notifications	BUILT
HosREC / HosDESK Reception	Front office reports faults and housekeeping issues, logs guest requests, deliveries and incidents, records fire alarm tests and drills, and sees live room status.	Fault report · housekeeping issue (flags today's room) · guest requests · deliveries · incidents · fire tests & drills · safety checks · wall-board mode with clock, weather and quick links	BUILT
F&B	Daily figures entered once on a phone feed the desktop tracker; opening and closing checks capture fridge temperatures; an out-of-range reading raises a maintenance job automatically.	Daily figures (covers, revenue, breakfast/dinner) · opening/closing checks · fridge temperatures · menus & 86'd list · F&B faults · bar stock (114 lines)	BUILT
HosSALES / HosVENUE	Shared enquiries pipeline for meetings, weddings and events; corporate database; quote builder on desktop.	Pipeline by stage · follow-ups & owners · corporate accounts (66) · supplier database (162) · quote builder	PARTIAL
HosFIRE Fire & compliance	Online fire-safety records: weekly checks, drills, marshals, training matrix, policies, actions diary — and a PDF pack for the inspector.	Checks with names and dates · drills & activations · training matrix · diary of actions · mobile app for the fire marshal · inspector PDF · scheduled compliance tasks	BUILT

What is built — module by module (continued)

Module	What it does on the ground	Key functions	Status
HosPEOPLE	Staff directory, rota, QR clock-in on the staff's own phones, actual-vs-rostered hours costed for payroll.	Rota · forecast · QR clock-in with PIN and location check · "on site now" panel · rota-vs-clock reconciliation · HR data behind a payroll password	BUILT
HosMARKETING	Guest Wi-Fi captive portal captures every guest's details with consent; a guest database, heat-map and newsletter templates turn footfall into a marketing asset.	Captive portal · guest DB with filters · 50 access points mapped to areas · growth, device and busiest-time charts · guest map · newsletter templates · CSV/Excel export	BUILT
HosREV Revenue	Recommends a rate per room type per night from occupancy, competitor rates within 20 miles and local events; the manager approves before anything changes.	Recommend & approve · comp-set monitoring · events calendar · ADR / RevPAR tracking · rate-shopper and PMS feeds (in progress)	PARTIAL
P&L Dashboard	Monthly management accounts as a live, login-gated dashboard with department detail and a 12-month forecast.	Overview · department detail · filters · 12-month forecast	BUILT
Hotel Overview & Daily Report	Managers' home: occupancy, arrivals, departures, needs-attention list, every department's numbers, Rooms 360°, daily PDF.	Today / 7 days / Rooms 360° · consolidated daily operations report	BUILT
Live PMS integration	Guestline "API for Own Use" (Report Data, Event Archive, Rezlynx SOAP) to pull daily occupancy, ADR, RevPAR and revenue automatically.	Order form agreed; forecast data flows today, live feed next	PLANNED
HosPRO Intelligence	The AI layer: assistant, forecasting, agents and voice on top of the operating data.	See AI vision	JV

Also live: a second property (The Barn Hotel, Ruislip — 70 rooms, 4 buildings) on HosDESK + HosFIX with its own data collections, cloned and branded in one day, proving the multi-property model.

Three things worth noticing in the matrix

Operations came first

The modules in daily use are the unglamorous ones — rooms, faults, fridges, fire tests. That is where a hotel's cost and risk sit, and where adoption has to be won before anything "intelligent" is credible.

Every module produces evidence

Photos, timestamps, names and costs are captured as a by-product of doing the job. Reports and PDFs are generated, never compiled — and the same records become training data for the AI layer.

The gaps are deliberate

Live PMS feed, push, auth hardening and the intelligence layer are the items we expect a partner to accelerate. They are engineering and AI problems, not hotel problems — and the hotel problems are solved.

6 · HOW IT CONNECTS

One action, everywhere: the life of a fault

The value of HosPRO is in the hand-offs. A housekeeper taps "Report a fault" on a room; eleven things happen without anybody sending a message. This is the swim-lane for a single leaking tap.

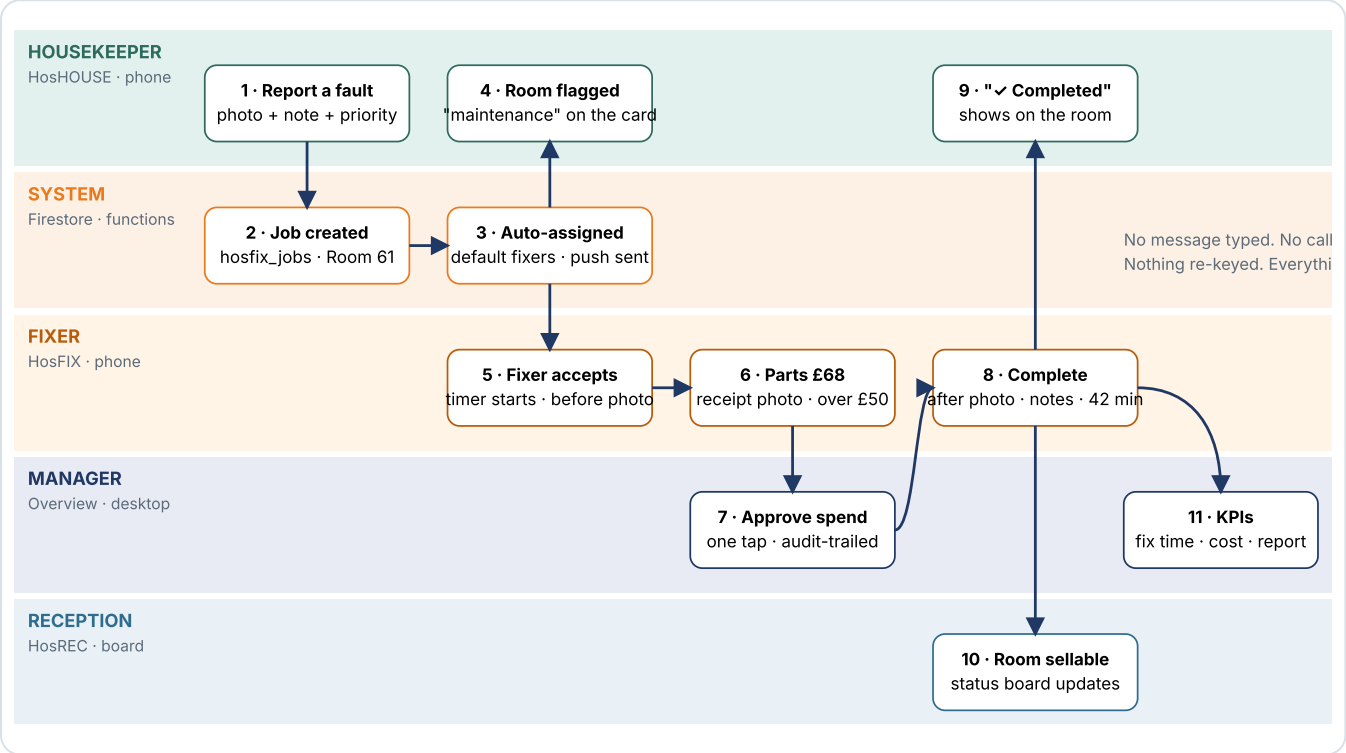

Figure 4 · Swim-lane of a single maintenance fault across four departments and the system

Other automatic flows already live

- Failed fire-alarm test or activation → urgent HosFIX job
- Fridge temperature out of range → high-priority job
- Reception "housekeeping issue" → today's room flagged urgent in HosHOUSE
- Daily F&B figures → desktop tracker and manager overview

What the manager sees

- Needs-attention list: urgent open jobs, blocked rooms, overdue follow-ups
- Rooms cleaned vs planned, raised vs fixed, open by area
- Rooms 360°: everything that ever happened to one room

Why this is the AI foundation

Every arrow in Figure 4 writes a timestamped, attributed, photographed record. Within months a hotel holds thousands of structured events: who, where, what, how long, how much. That is exactly the data an AI layer needs — and exactly what no hotel has today.

6 · HOW IT CONNECTS

How departments and modules interact

Every department both **feeds** and **reads** other departments' modules. The grid shows who writes to what; the flow map underneath shows the automatic hand-offs that already run between modules without a message being sent.

	HosHOUSE	HosFIX	HosREC	F&B	HosSALES	HosFIRE	HosPEOPLE	HosREV	Overview
Directors / GM	●	● approve	●	●	●	●	●	● approve	● own
Housekeeping	● own	W report	R	–	–	–	R rota	–	feeds
Maintenance	W status	● own	R	R	–	● checks	R rota	W rooms OOO	feeds
Reception	W day · issues	W report	● own	R menus	W enquiry	W tests	R rota	–	feeds
F&B / kitchen	–	W report	R	● own	R events	R	R rota	–	feeds
Sales & events	R arrivals	R OOO	R	W function sheets	● own	–	–	W group holds	feeds
Fire marshal	–	W auto-job	R	–	–	● own	–	–	feeds

● own / full · W writes into · R reads from · "feeds" = contributes to the managers' overview and daily report. "OOO" = rooms out of order.

Figure C · Who writes to and reads from each module — the operating layer is a web, not a hierarchy

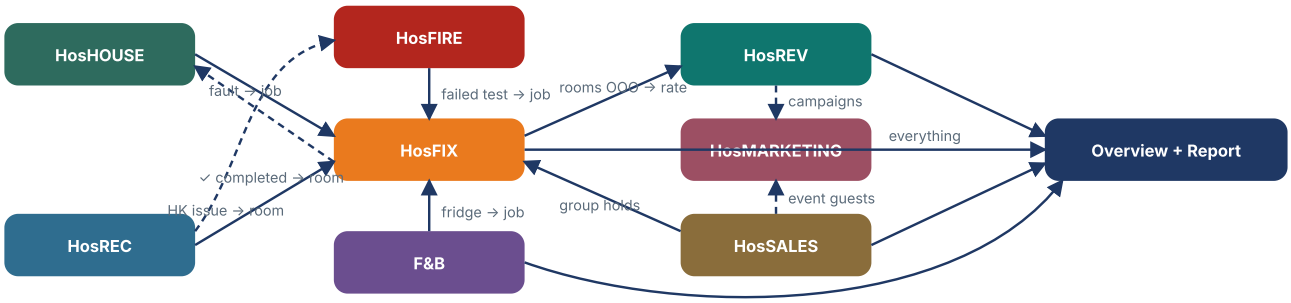

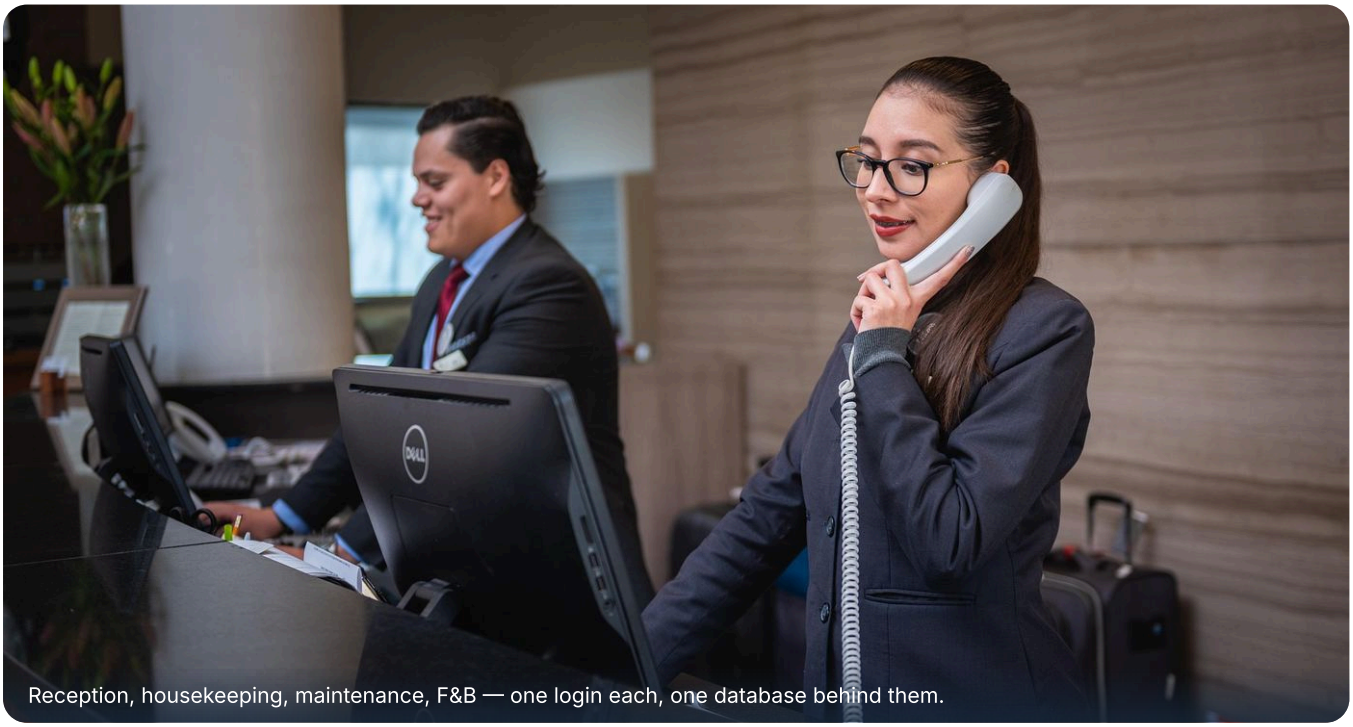

Figure D · Automatic hand-offs between modules (solid = live today, dashed = built, awaiting feed or in the next phase)

Reception, housekeeping, maintenance, F&B — one login each, one database behind them.

7 · ON THE GROUND

A day in a HosPRO hotel

The same 120-room property, a normal Tuesday. Each entry is a screen somebody actually opens — no imaginary workflows.

06:45 — **Reception** opens HosDESK on the wall board: overnight incidents, fire test due today, deliveries expected, open faults. Sets the day's rooms from the PMS arrivals list in HosHOUSE.

07:30 — **Housekeeping lead** taps "Allocate" — 84 rooms split across 7 housekeepers by skill, rating and floor in seconds. Each phone shows its own list; nobody prints anything.

08:00 — **Fixers** open HosFIX: 6 open jobs, 2 urgent, already assigned. Heating in 151 first. Timer on. Nobody has phoned anybody.

08:15 — **Kitchen** does the opening check: fridge temperatures keyed in; one at 9 °C raises a high-priority maintenance job automatically.

09:40 — **Housekeeper** in Room 61: start → photo checklist → spots a bath leak → "Report a fault" with photo → finishes room → completion photos → sign off. 24 minutes, all evidenced.

10:30 — **General manager** glances at Overview: 31/84 rooms done, 2 blocked, 9 open jobs, one £68 spend waiting — approves it from the phone between meetings.

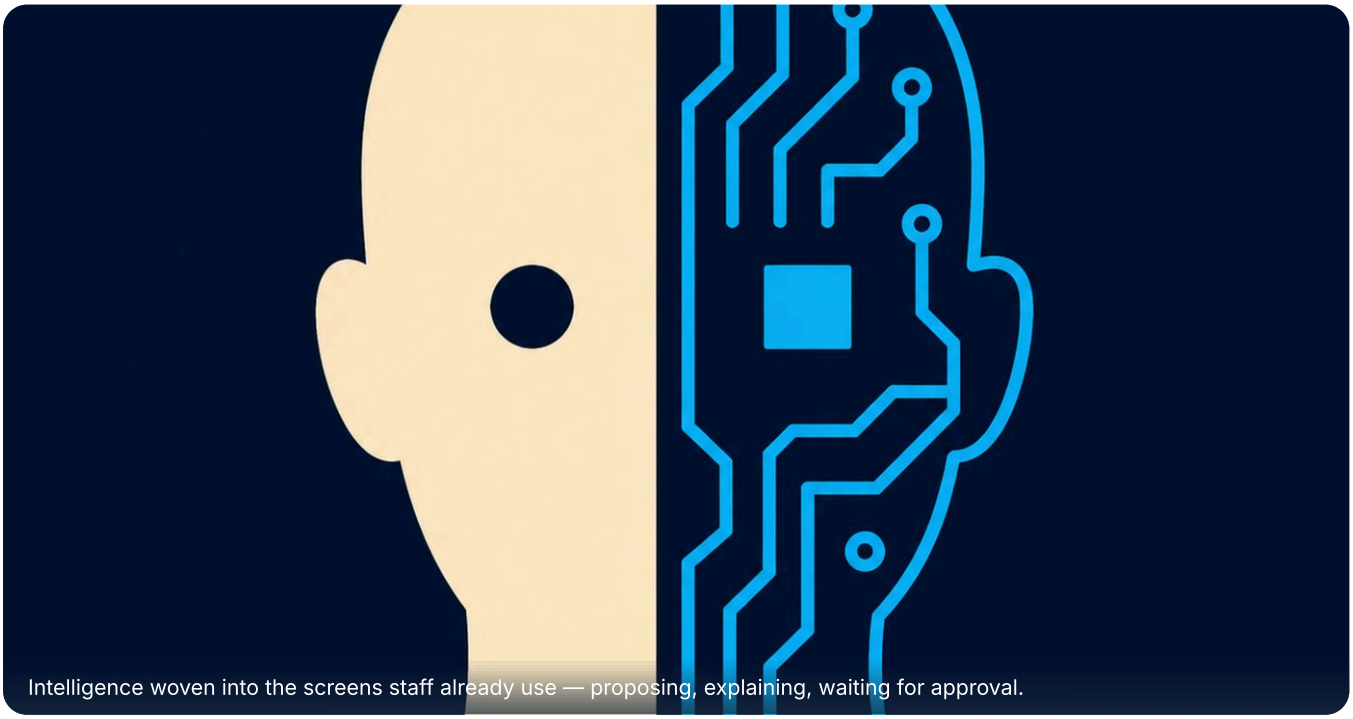

11:00 — **Revenue** — HosREV flags Saturday: comp-set rates up 11%, a local event, 78% booked. Recommends +£14 on Classic and Superior. Manager approves two of three.

14:00 — **Sales** logs a 60-delegate conference enquiry; it appears in the pipeline, in the manager's overview and on tomorrow's follow-up list.

16:00 — **Fire marshal** runs the weekly alarm test from HosFIRE Mobile: call-point, time, result, name. The inspector pack is already up to date.

23:00 — **Owner** opens the Daily Operations Report: occupancy, rooms cleaned, faults raised vs fixed, F&B sales, pipeline, incidents. One page. Zero people compiled it.

Figure 5 · Ten moments in one operating day — every one is a real HosPRO screen

Intelligence woven into the screens staff already use — proposing, explaining, waiting for approval.

8 · THE BUSINESS CASE

Where the efficiency, savings and profit come from

Illustrative annual model for a 120-room independent hotel with spa, restaurant and events, based on the levers HosPRO already operates. Figures are conservative estimates for discussion, not audited results; each hotel calibrates its own in the first 90 days.

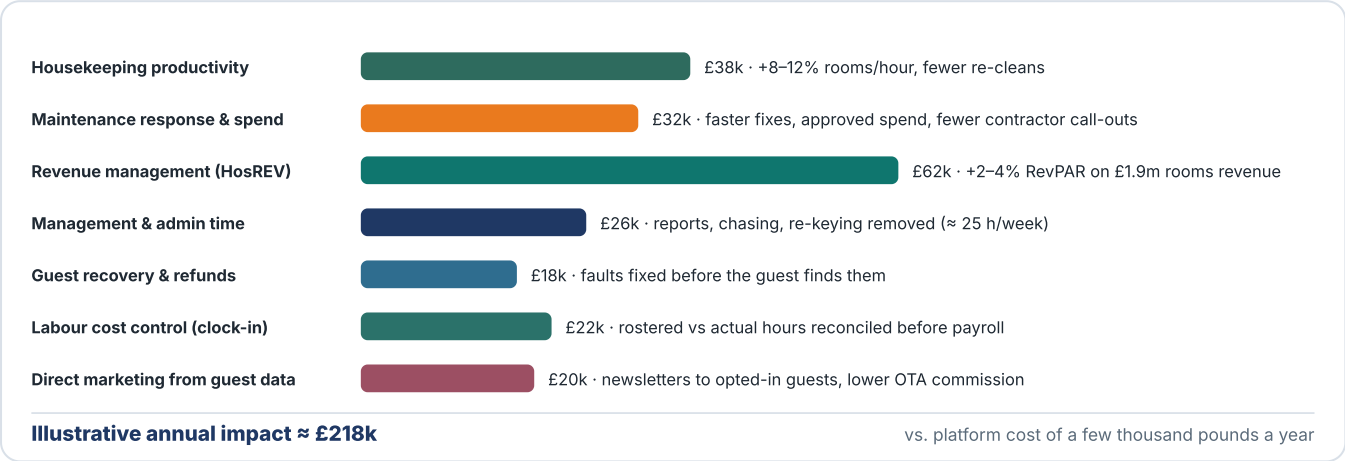

Figure 6 · Seven levers, one hotel — the operating layer pays for itself many times over

How each lever works

Lever	Mechanism
Housekeeping	Allocation by skill and floor; timed rooms; photo standards cut re-cleans and complaints; live board removes supervisor walking.
Maintenance	No lost faults; default assignment; timers and costs per job; £50 gate stops unapproved spend; receipts captured at source.
Revenue	Daily comp-set and event-aware recommendations; approve in one tap; ADR/RevPAR tracked against the plan.
Admin	Daily report, PDFs, dashboards generated from data already captured — no re-keying.
Labour	QR clock-in on staff phones; actual vs rostered costed before payroll; "on site now" visibility.
Marketing	Wi-Fi captive portal: roughly 80 guest records a day with consent; email direct, reduce OTA dependence.

Productivity on the floor

24 min
median room time captured with photo proof (was unknown)

< 1 h
target first response on urgent faults, measured per job

1 page
daily operations report instead of a weekly compilation

0 re-keys
figures entered once, used everywhere

Why it compounds

Each module makes the next cheaper: housekeeping already knows the rooms, maintenance already knows the fixers, reception already knows today's arrivals. By the tenth module the marginal cost of a new department is a configuration file. And every month of operation adds data that makes the AI layer more accurate for that hotel.

9 · TECHNICAL ARCHITECTURE

System architecture as built

Deliberately simple: static web apps on GitHub Pages, a managed document database, a handful of cloud functions and one small VM. No servers to patch, no framework lock-in, and a monthly running cost in the tens of pounds. Simple enough to clone for a new hotel in a day; structured enough to carry an AI layer.

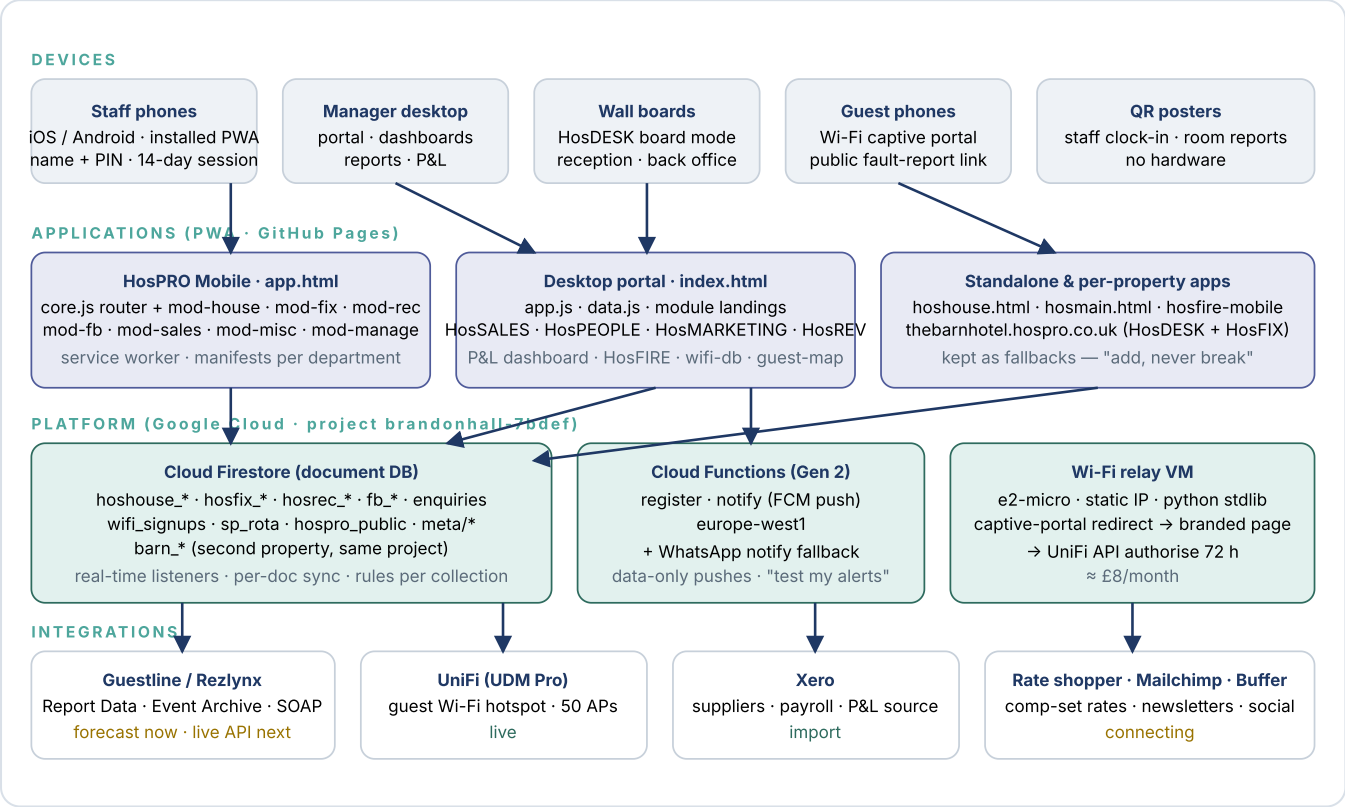

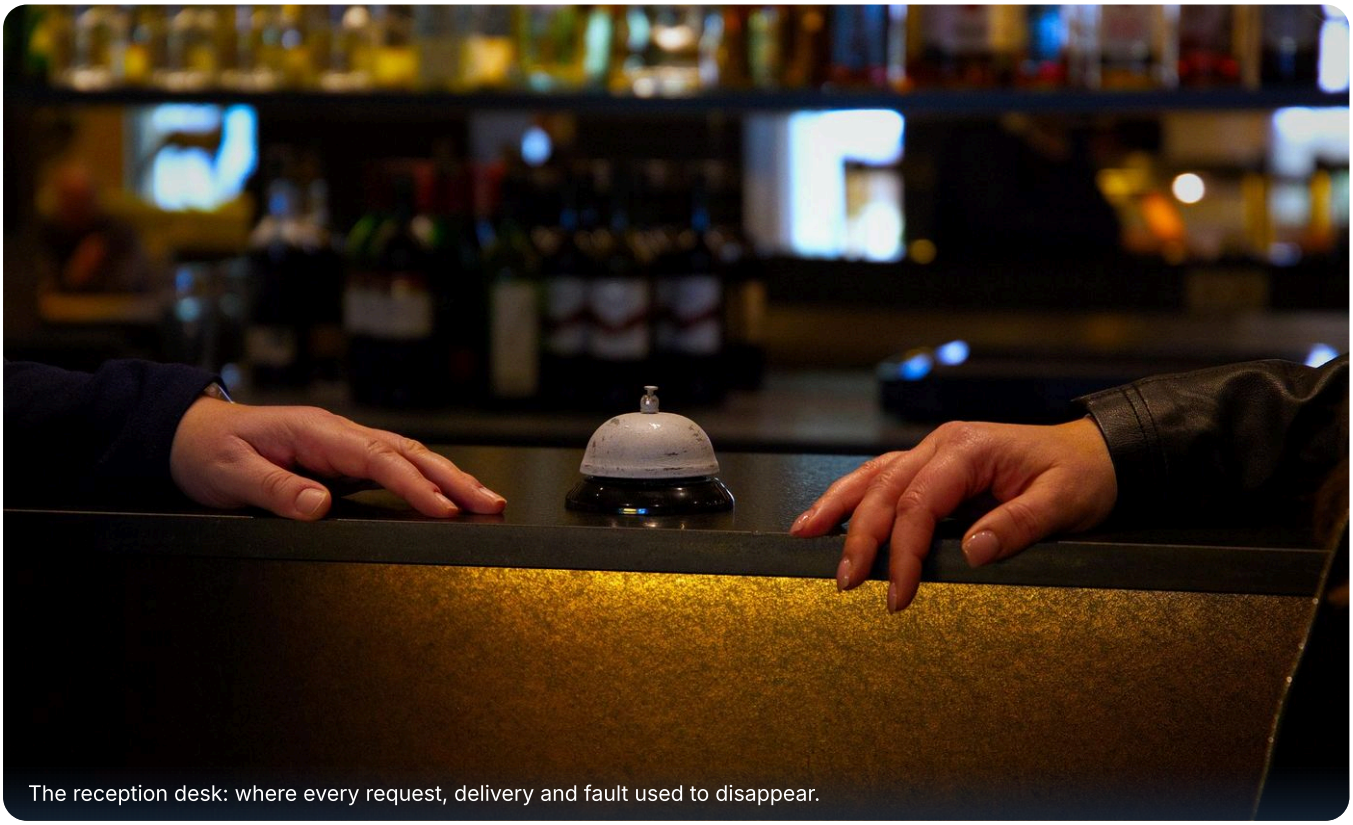

Figure 7 · Four layers: devices → applications → platform → integrations

The reception desk: where every request, delivery and fault used to disappear.

Technical workflows: how data moves, syncs and alerts

Four sequence views of the mechanisms behind the hand-offs: the real-time data path on a phone, the three automatic-job triggers, the notification chain, and the per-property isolation that lets one platform serve many hotels.

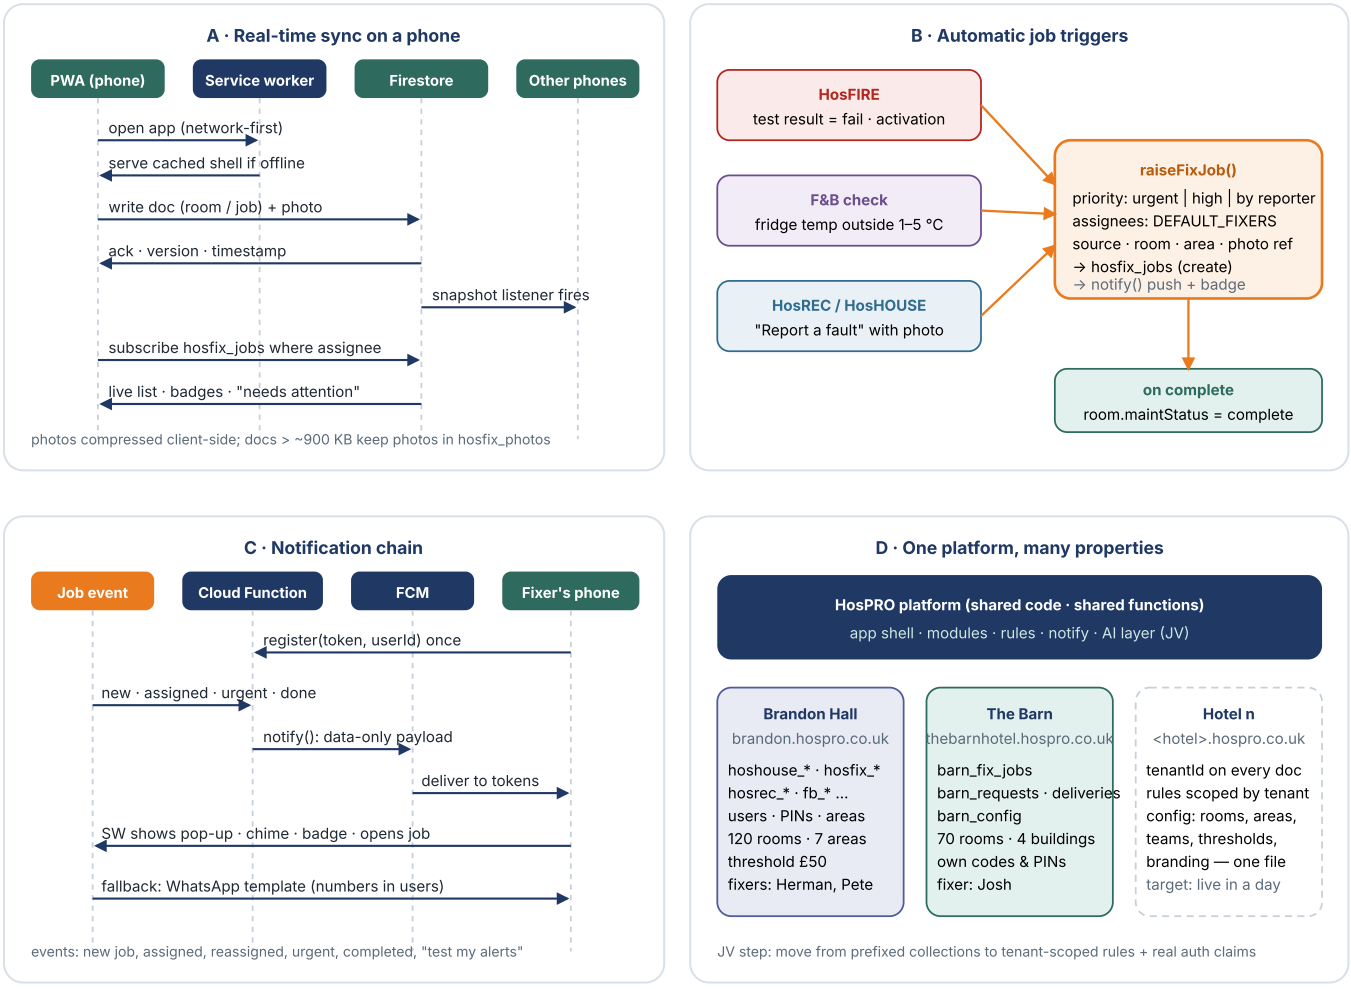

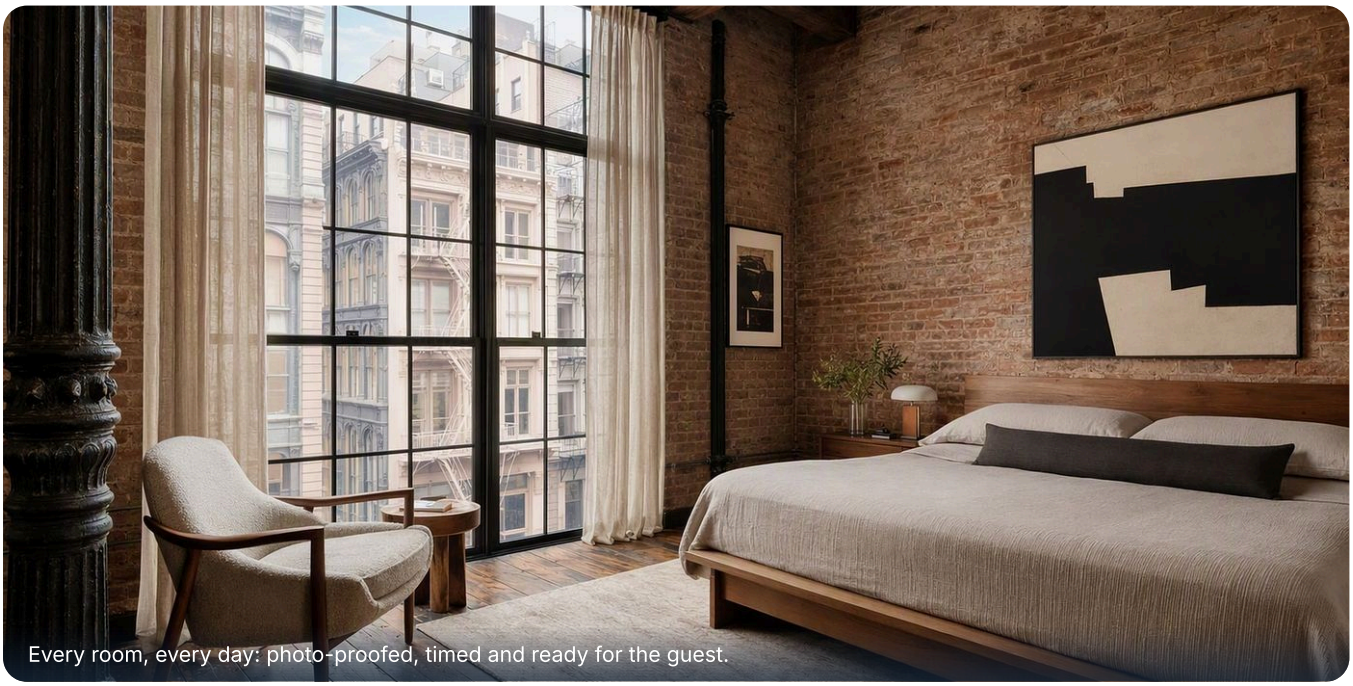

Figure E · The four mechanisms behind the platform: sync, triggers, notifications and multi-tenancy

Every room, every day: photo-proofed, timed and ready for the guest.

The data model: one hotel, one set of collections

Firestore collections as deployed. Rooms are the hub: housekeeping, maintenance, reception and the overview all key on the room, so "Rooms 360°" is a query, not a report. A second property uses the same shapes under its own prefix (`barn_*`).

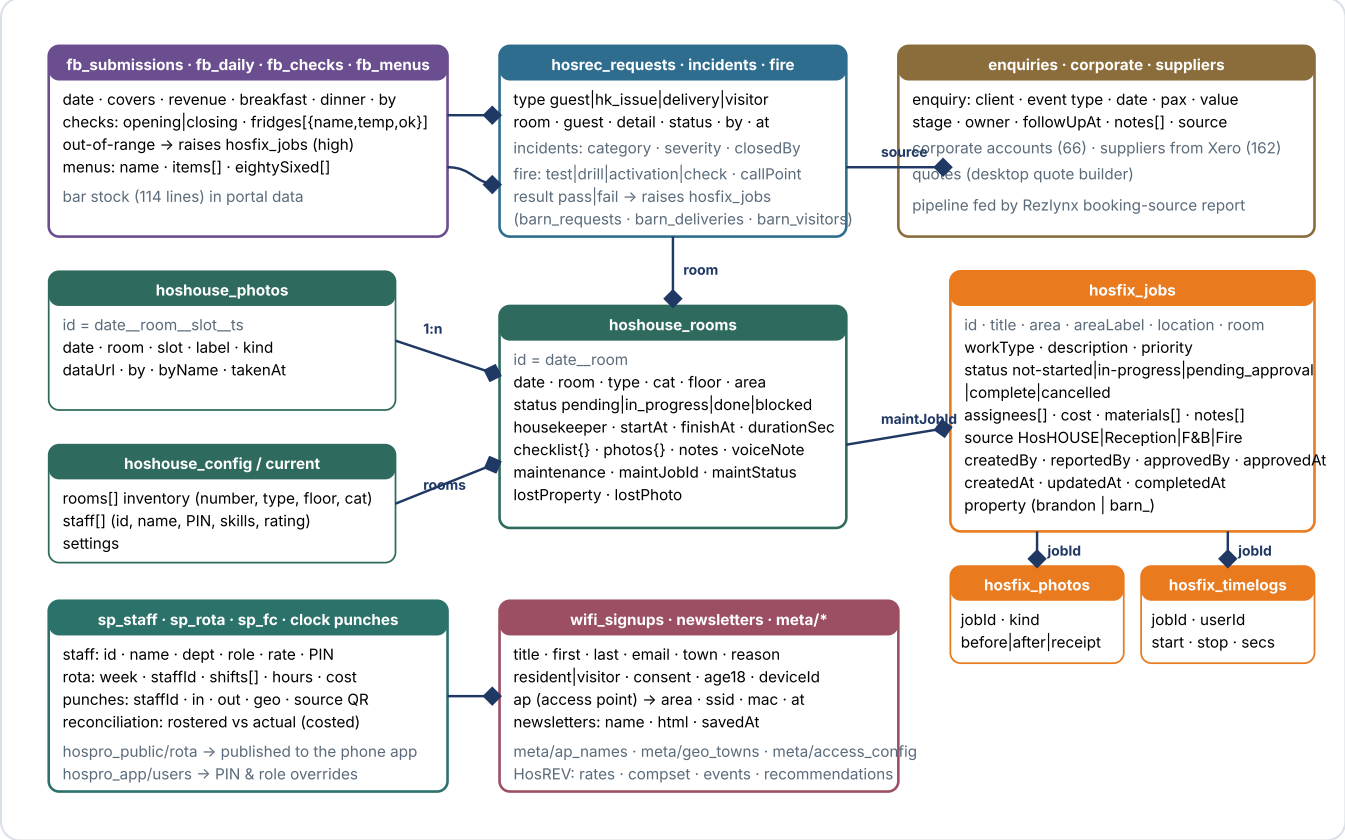

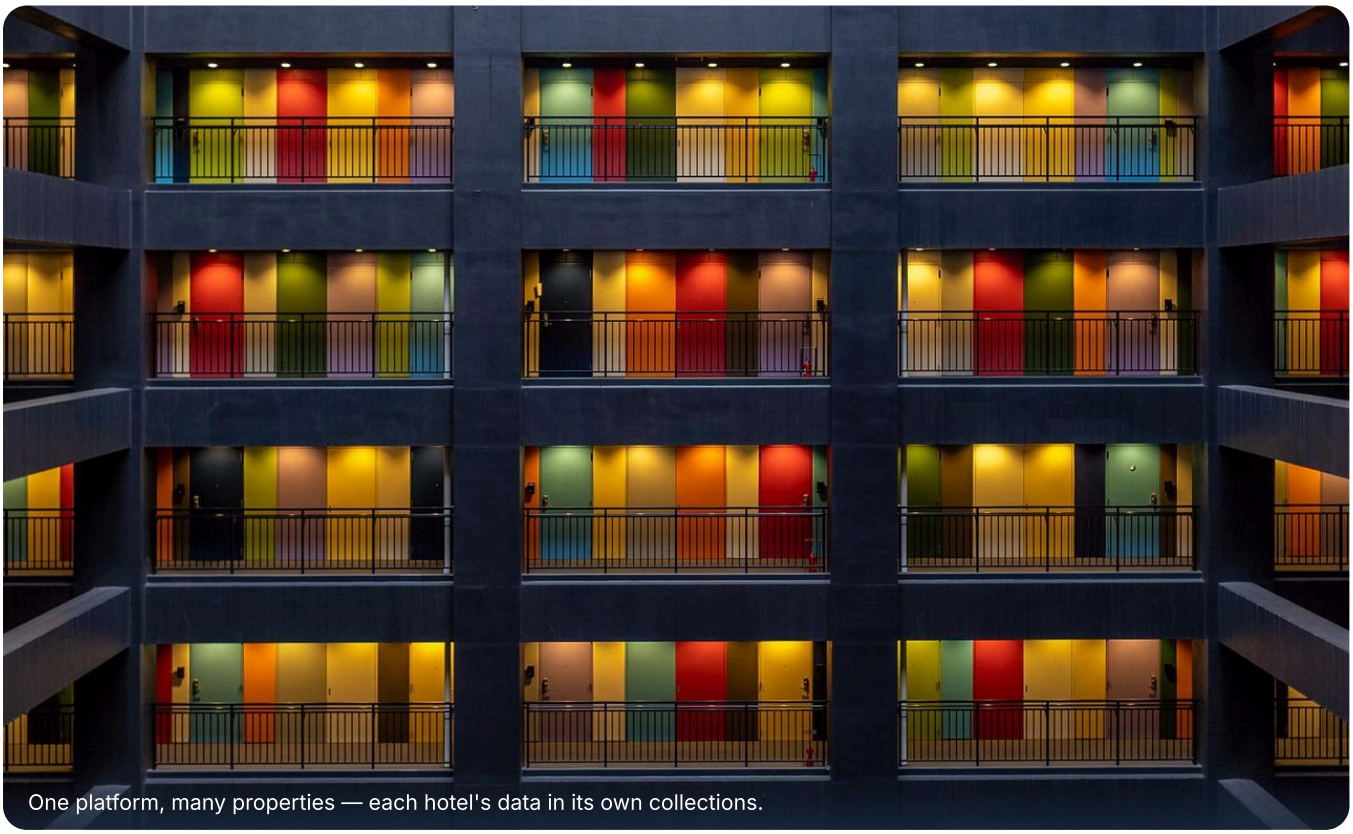

Figure 8 · Entity map of the live collections — colour = owning module; arrows = keyed relationships

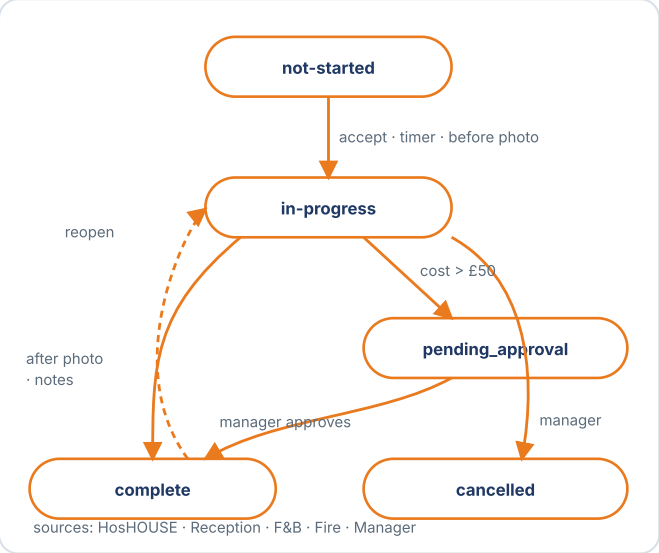

One platform, many properties — each hotel's data in its own collections.

Lifecycles: how a job and a room change state

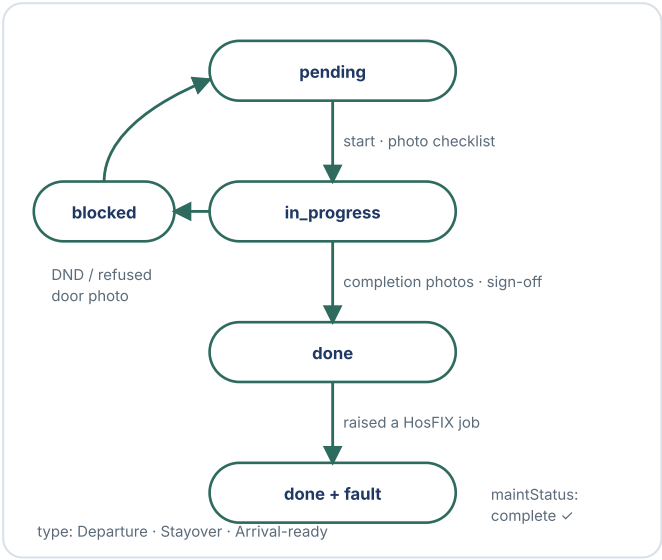

Two state machines carry most of the operational logic. They are deliberately small — a fixer never has to choose from twelve statuses — and every transition writes who, when and (where relevant) a photo.

Maintenance job (hosfix_jobs.status)

Default assignees are set per hotel; the approval threshold and approvers are configuration, not code. Completion writes `maintStatus: complete` onto the room record so housekeeping sees "✓ Completed by maintenance".

Room for the day (hoshouse_rooms.status)

Allocation happens before `pending`: the lead chooses auto (skill, rating, floor) or manual. Each transition stores start/finish timestamps, so room duration and rooms-per-hour are measured, not estimated.

Access model

Tiers

Manager (admin) — everything, approvals, reassign, reports. **Lead** — their department, can close incidents. **Fixer** — only jobs assigned to them. **Staff** — their department's modules and their own reports.

Department → modules

Housekeeping: HosHOUSE · Maintenance · Rota. Maintenance: Maintenance · Fire · Compliance · Rota. Reception: Reception · Housekeeping board · Maintenance · Fire · Rota. F&B: F&B · Maintenance · Fire · Rota. Sales: Sales · Fire · Rota.

Hardening (next)

Today: app-level PIN login with open rules on shared collections, matching how the hotel operates. Next: Firebase Auth with role claims, per-collection rules, audit log — a natural fit for a partner platform with permissions and approvals built in.

11 · MAINTENANCE EFFICIENCY

Maintenance: the fastest money a hotel can save

Maintenance is where independent hotels bleed quietly: rooms out of order that could be selling, contractors called for jobs the team could do, parts bought twice, and no idea what anything costs until the invoice. HosFIX already closes most of these gaps; the AI layer closes the rest.

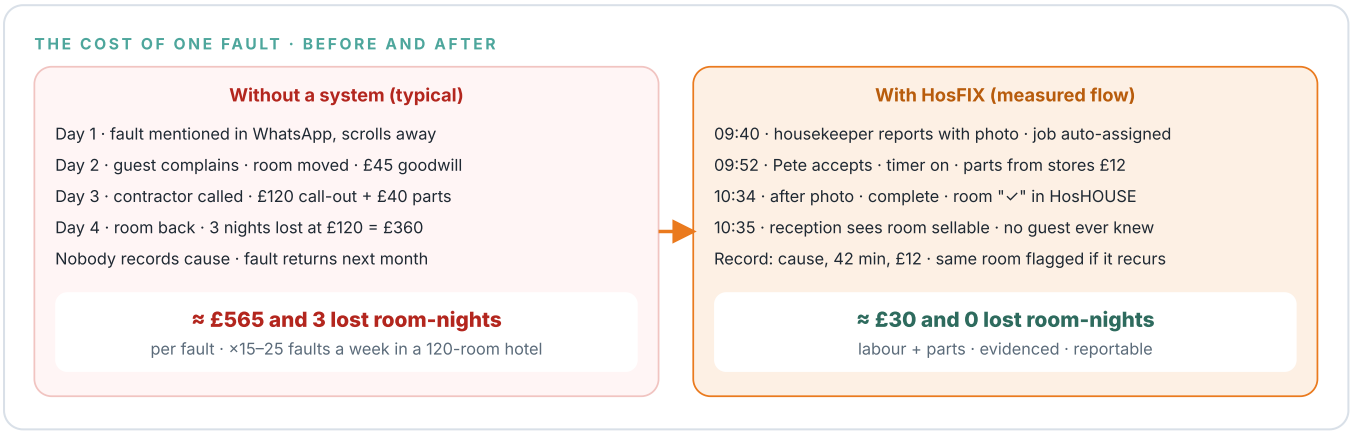

Figure F · The same bath leak, twice — the difference is the system, not the fixer

KPIs HosFIX produces today

Measure	How it is captured
First response time	createdAt → accepted (timer start)
Time to fix	hosfix_timelogs per job and per fixer
Cost per job / per area / per month	materials + receipts + labour minutes × rate
Rooms out of order (nights)	job open on a bedroom × nights
Repeat faults by room/asset	same location & work type within 90 days
Contractor vs in-house spend	approval gate > £50 with approver and reason
Fixer workload & balance	open jobs and minutes per assignee

What AI adds (JV scope)

- **Triage from a photo and a sentence** — work type, priority, likely parts, the right fixer, and whether the room is sold tonight.
- **Predictive maintenance** — recurring faults per room and asset (boilers, showers, locks, fridges) scheduled before they fail; seasonal patterns learned per property.
- **Contractor decision support** — "this is a £12 in-house job" vs "call the gas engineer"; approval requests drafted with the evidence attached.
- **Parts and stock** — usage per job type; reorder prompts; cost benchmarks across the estate.
- **Voice on the job** — fixers log materials, notes and completion hands-free.
- **Rate link** — rooms out of order feed HosREV so inventory and pricing reflect reality.

Target outcomes (per 120-room hotel)

Urgent first response under 1 hour · average fix time −30% · out-of-order nights −50% · contractor spend −25% · every job costed. Measured in the 90-day build-and-measure.

12 · REVENUE MANAGEMENT

HosREV: rate recommendations a GM can trust

Most independent hotels price by instinct or copy the neighbour. HosREV gives them a revenue manager in the app: every day it looks at pick-up, the competitive set within 20 miles, local events and seasonality and proposes a rate per room type per night. Phase 1 is deliberately **recommend and approve** — nothing changes in the PMS without a human tap. That is common sense, and it is how trust is built before automation.

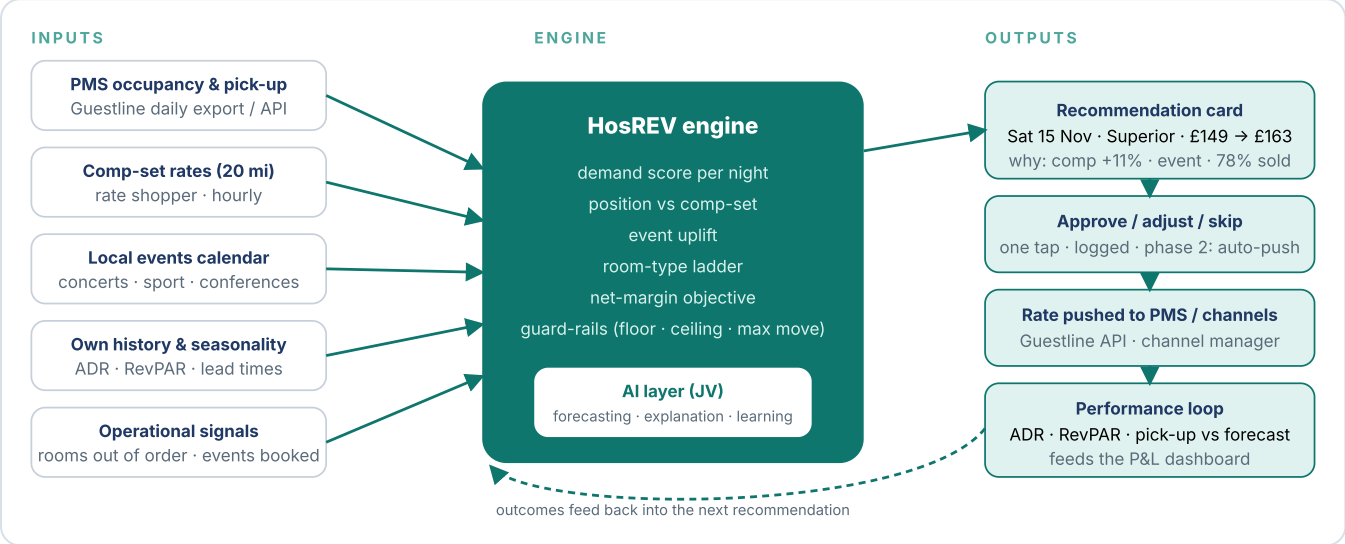

Figure 9 · HosREV data flow — inputs, engine, human approval, PMS push and the learning loop

Built today

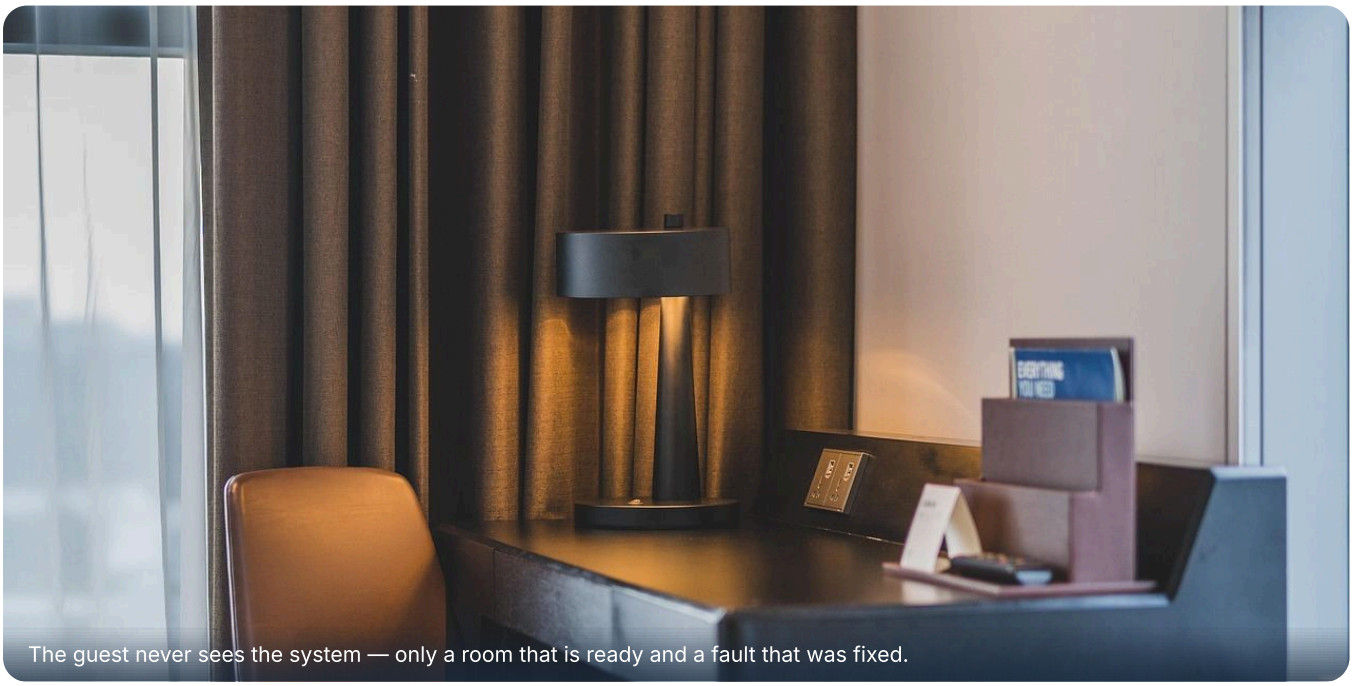

Recommendation engine on demo and hotel-supplied data · room-type ladder · comp-set and events calendar · ADR/RevPAR tracking · approval workflow · access-gated for the revenue lead.

Connecting now

Rate-shopper feed (Lighthouse / Makcorps class) for live comp-set rates · daily Rezlynx export → then the live Guestline API · channel push for approved rates.

With the JV

Demand forecasting models per property · natural-language explanations ("why this rate?") · "ask HosREV" conversational queries · confidence-based auto-approval within guard-rails · group and events pricing.

The guest never sees the system — only a room that is ready and a fault that was fixed.

Rates vs competitors: where HosREV sits in the market

Automated revenue management for independents is a proven category with real results — which is why it belongs in the JV. Two leading AI pricing tools show what the market expects and pays for; HosREV adds the one input none of them have.

	Pricepoint	RoomPriceGenie	HosREV (HosPRO)
Positioning	"AI revenue agent" pricing rooms continuously from bookings, cancellations and demand	Automated revenue management for independents; "trusted by over 5,000 hotels"	Revenue management inside the hotel's operating platform — rate decisions aware of what is happening in the building
Core inputs	Pick-up, demand forecast (ForecastIQ), event detection, market signals; competitor rates optional	Availability, occupancy trends, competitor rates, market demand	PMS pick-up, comp-set within 20 miles, events, own history **plus** rooms out of order, group holds from sales, F&B and events calendar
Automation	24/7 price updates; AI strategy builder; smart min-stay / CTA restrictions	Autopilot; real-time surge protection; minimum-stay rules; group displacement calculator	Phase 1 recommend & approve (built); phase 2 guard-railed auto-approval with confidence scores and plain-English reasons
Distribution	32+ PMS / channel managers (Mews, Cloudbeds, SiteMinder, Oracle…); prices pushed automatically	Rates distributed via PMS / channel partners (e.g. Profitroom) to OTAs and direct	Guestline API first; channel-manager connectors in the JV roadmap
Claimed results	Customer cases: room revenue +41.8% (independent hotel, first season); RevPAR up to +17.1% (hostel group)	"19% revenue boost" headline; time saved	Target +2–4% RevPAR conservatively modelled; measured per property in the 90-day pilot
Commercials	Per-property subscription by size; single all-inclusive plan; 30-day trial; 12% annual discount; partner commission 15%	Per-property subscription (plans on request)	Bundled in the HosPRO per-property subscription; intelligence tier on top
Operations link	None — prices rooms, blind to housekeeping, maintenance, events ops	None	**Native** — same database as HosFIX, HosHOUSE, HosSALES, F&B

Competitor information from pricepoint.co and roompricegenie.com (Nov 2026); figures are their published claims and customer cases.

What the market proves

Independents will pay a per-property subscription for pricing automation, and they get double-digit uplifts when they do. RMS is no longer exotic — it is a line item a 70-room hotel expects.

Our edge

Every RMS prices the hotel it *thinks* exists. HosREV prices the hotel that exists today: two suites out of order, a 60-pax conference holding eight rooms, a wedding closing the restaurant. Operational truth is a pricing input nobody else has.

JV scope

Partner-grade forecasting, event detection and explanations; rate-shopper and channel connectors; guard-railed autopilot; group displacement and events pricing; a benchmark across the HosPRO estate. Optionally, integrate with an existing RMS as the operational feed rather than compete head-on.

Winning more business: venue sales, events and direct bookings

A hotel's fastest top-line lever is usually sitting in the enquiries inbox. Meetings, weddings and events are high-margin, book months ahead and fill restaurants and bedrooms together — and most independents answer those enquiries in days, by hand. HosPRO already has the pipeline, the corporate database and a website configurator; the JV adds an agent that answers in minutes.

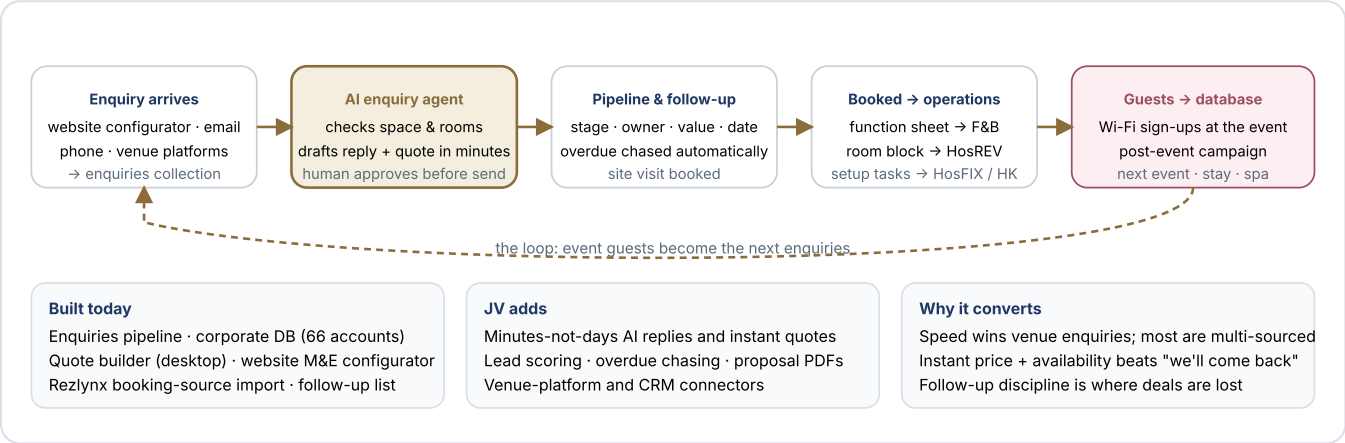

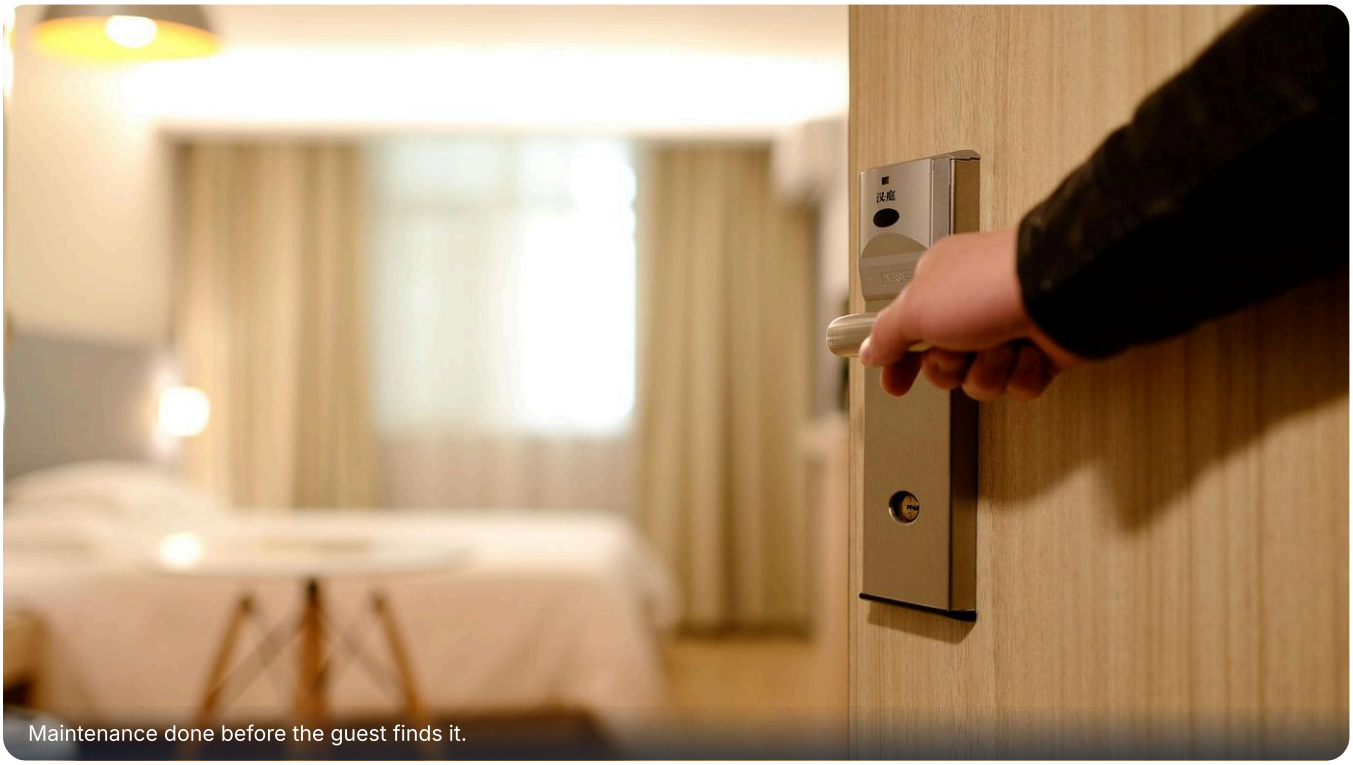

Figure G · The venue-sales loop from enquiry to repeat business

Direct bookings and OTA cost

Every opted-in guest in HosMARKETING is a booking the hotel can win without paying 15–20% commission. Campaign generation, segmentation (spa, dining, events, repeat stays) and timing are AI tasks on data the hotel already owns. Target: direct share +5 points in year one.

Commercial plan built in

HosPRO's consultancy arm runs 90-day commercial plans (corporate, meetings, groups, events) for its hotels. The platform turns those plans into trackers, targets and weekly numbers — software and service from the same team, which is how independents actually buy.

Maintenance done before the guest finds it.

14 · GUEST DATA & MARKETING

The marketing engine: turning Wi-Fi into a guest database

Hotels have thousands of people walk through their doors who never become a contact. HosPRO's captive portal captures them with consent in the thirty seconds it takes to join the Wi-Fi — around 80 records a day at Brandon Hall from the first day live — and gives the hotel a database, a map and a newsletter tool it owns.

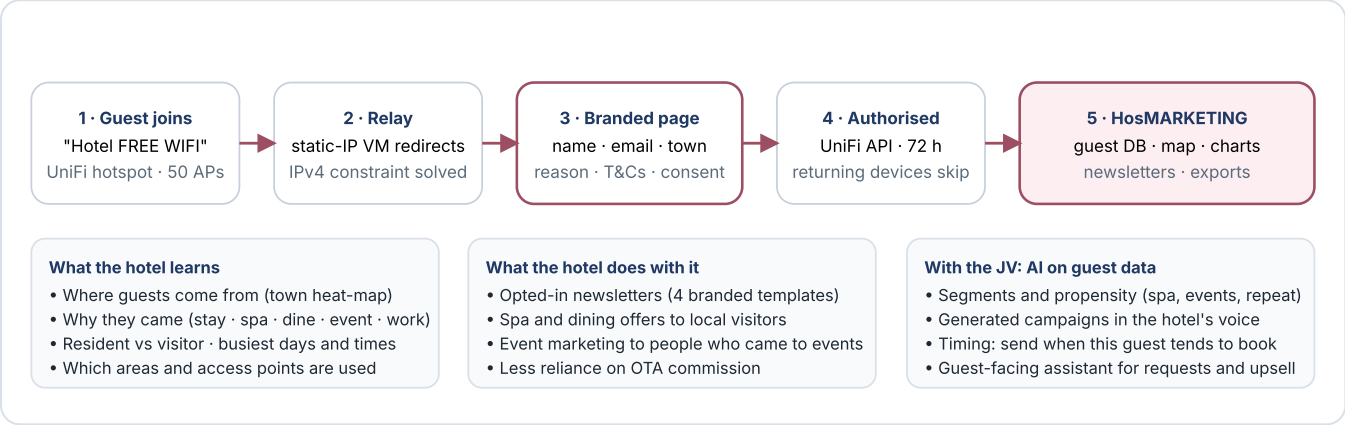

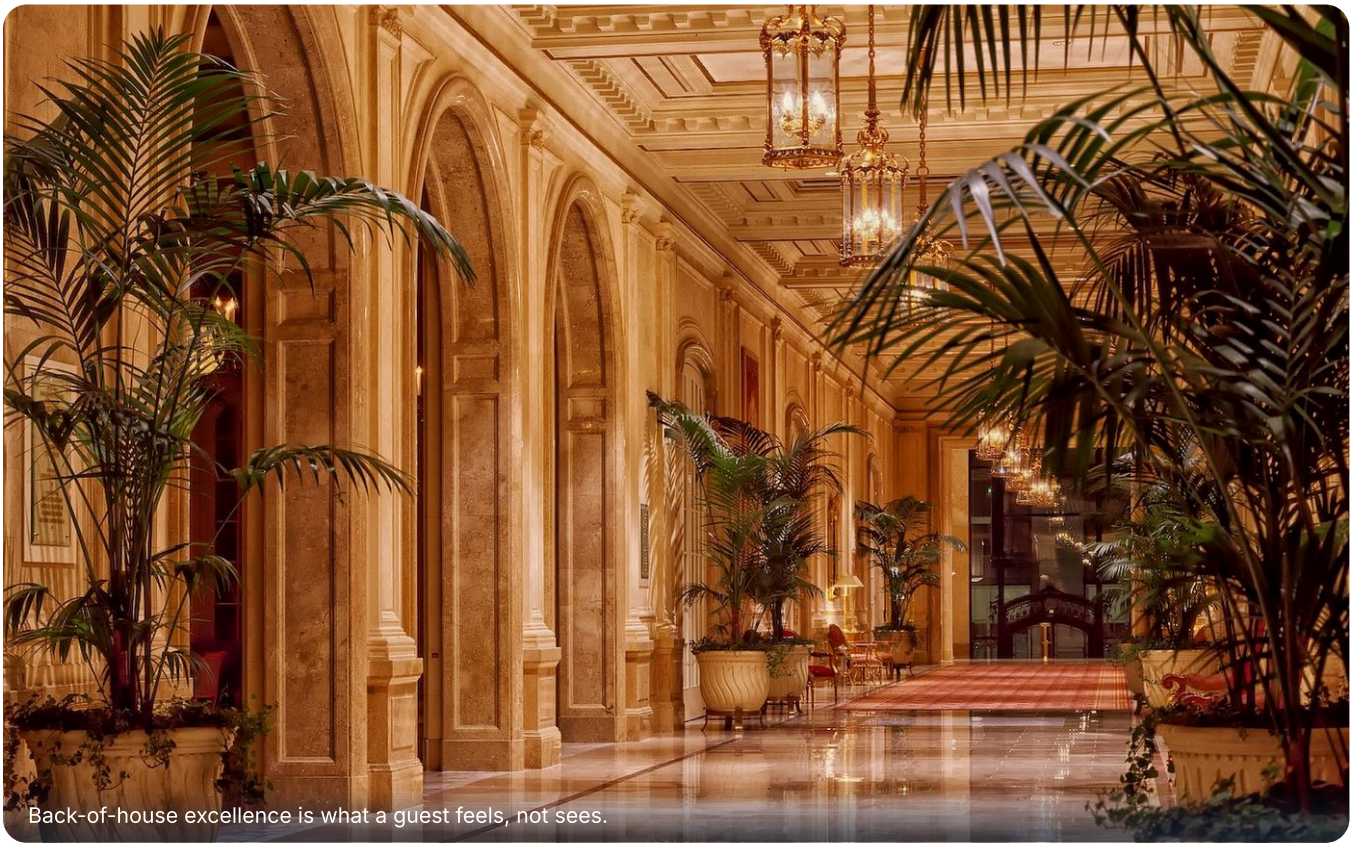

Figure 10 · From hotspot to newsletter in five steps — the hotel owns every record

Privacy by design

Consent is explicit and unticked by default; "18 or over" is part of the marketing opt-in; terms link to the hotel's privacy policy; a guest record can be edited, unsubscribed or deleted in one click across all their visits; exports respect the filters. The hotel is the data controller and the data sits in its own project.

Why this matters to a JV partner

Guest data plus operational data in one place is rare below chain level. It makes genuinely useful AI possible: a guest who came for the spa twice, books Saturdays, lives 30 miles away and once reported a cold room is a sentence the system can already write — and act on.

Back-of-house excellence is what a guest feels, not sees.

15 · THE AI VISION

HosPRO Intelligence: AI that works the floor, not the slideshow

We do not want a chatbot bolted to the side. We want intelligence woven into the same screens people already open — predicting, drafting, prioritising and, with approval, acting. Everything below sits on the data the platform already captures. The layers build on each other, and each is useful before the next exists.

Figure 11 · The intelligence stack — each layer is built on the one beneath it and is useful on its own

Ten AI use cases, each tied to a module and a measurable outcome

Use case	What it does	Module	Outcome
Demand forecasting	Per-night occupancy forecast from pick-up, comp-set, events, history	HosREV	RevPAR +2–4%
Rate explanation & auto-approve	Plain-English "why", confidence score, auto-push inside guard-rails	HosREV	Revenue manager time ↓
Smart allocation	Proposes the day's housekeeping split from skills, timings and arrivals	HosHOUSE	Rooms/hour ↑, fairer load
Fault triage	Classifies photo + text, sets priority, picks the fixer, estimates parts	HosFIX	Response time ↓
Predictive maintenance	Learns recurring faults per room/asset; schedules before failure	HosFIX	Out-of-order rooms ↓
Compliance guardian	Watches checks and dates; assembles the inspector pack; flags gaps	HosFIRE	Audit-ready always
Enquiry follow-up agent	Drafts replies and quotes; chases overdue leads; books site visits	HosSALES	Conversion ↑
Guest segments & campaigns	Propensity models and generated newsletters in the hotel's voice	HosMARKETING	Direct bookings ↑
Voice on the floor	Fixers and housekeepers log by voice; hands stay free	All mobile	Capture rate ↑
Guest concierge	Message/voice requests routed to departments and tracked to completion	HosREC	Service recovery ↑

15 · THE AI VISION

What the intelligence looks like on the ground

Three mock-ups of how AI shows up inside existing HosPRO screens. The pattern is always the same: the system proposes, explains and waits; the person approves with one tap. Nothing "magic" — just less typing, less chasing and better decisions.

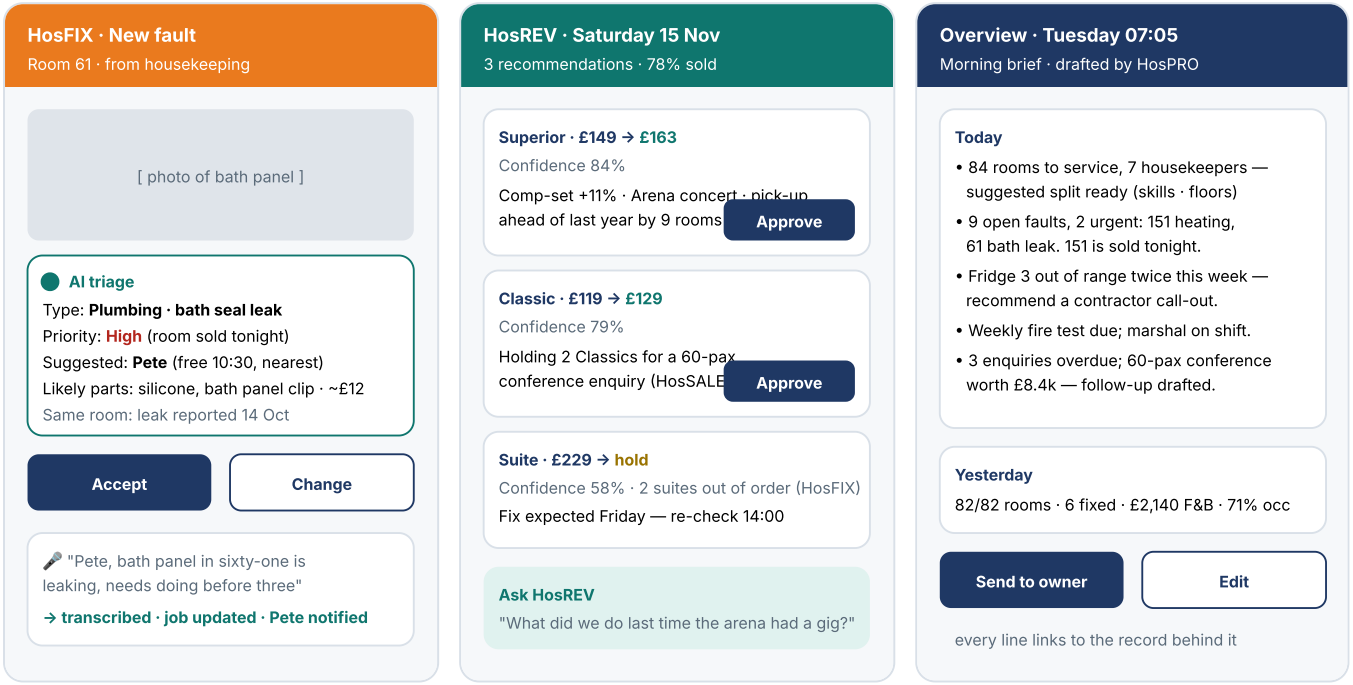

Figure 12 · Fault triage with voice · rate recommendations with confidence · a drafted morning brief

Design rules for the AI layer

- Proposes; a named person approves. Every action is attributable.
- Explains in one sentence a GM would say. No black boxes on the floor.
- Works inside existing screens — no new app, no new login.
- Degrades gracefully: if the model is down, the hotel still runs.
- Each hotel's data trains each hotel's behaviour; nothing leaks between properties.

What makes it feasible now

- The operating data already exists and is structured (see the database design).
- Approvals, thresholds and roles are already in the model — agents inherit them.
- Photos are captured on every job and room: vision models have real inputs.
- The PMS feed closes the loop on revenue and occupancy.
- A partner platform with permissions, agents and voice built in removes the plumbing.

16 · GUEST EXPERIENCE

AI for the guest: felt in the room, not in an app store

Guests do not download hotel apps. The guest-facing layer therefore lives where guests already are — the Wi-Fi welcome page, a QR in the room, WhatsApp or SMS, the phone on the desk — and routes every request straight into the department modules so it is tracked to completion.

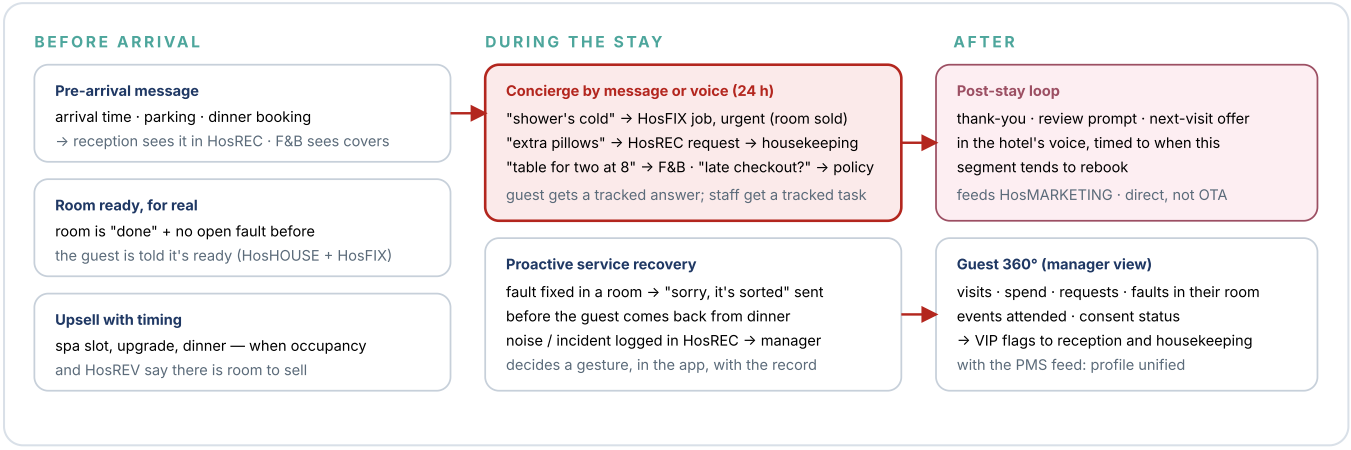

Figure H · The guest journey, and the module each moment lands in

Why ours is different

Most guest-messaging tools stop at the message. Because HosPRO owns the department modules, a guest request becomes a real task with an owner, a timer and a completion — and the guest is told when it is done.

Guardrails

Anything involving money, access or safety is handed to a person. The assistant never promises what the modules cannot track. Consent and privacy rules from the Wi-Fi portal apply throughout.

Measures

Request-to-done time · faults found by staff vs guests · review scores · repeat and direct booking share · upsell revenue per stay. All reportable from existing collections plus the guest profile.

Six months, three gates — every month ends with something live.

Target architecture: HosPRO + Ada Engine

Immediate Impact's Ada Engine describes itself as a foundation for designing, building, connecting and deploying custom AI-powered applications — combining interfaces, business logic, models, company knowledge, existing systems, permissions, human approvals, agentic actions and voice. That is almost exactly the layer HosPRO needs next. The fit is complementary: we bring the domain, the data model, the live properties and the operating know-how; the partner brings the engineering platform and AI capability to make it product-grade and scalable.

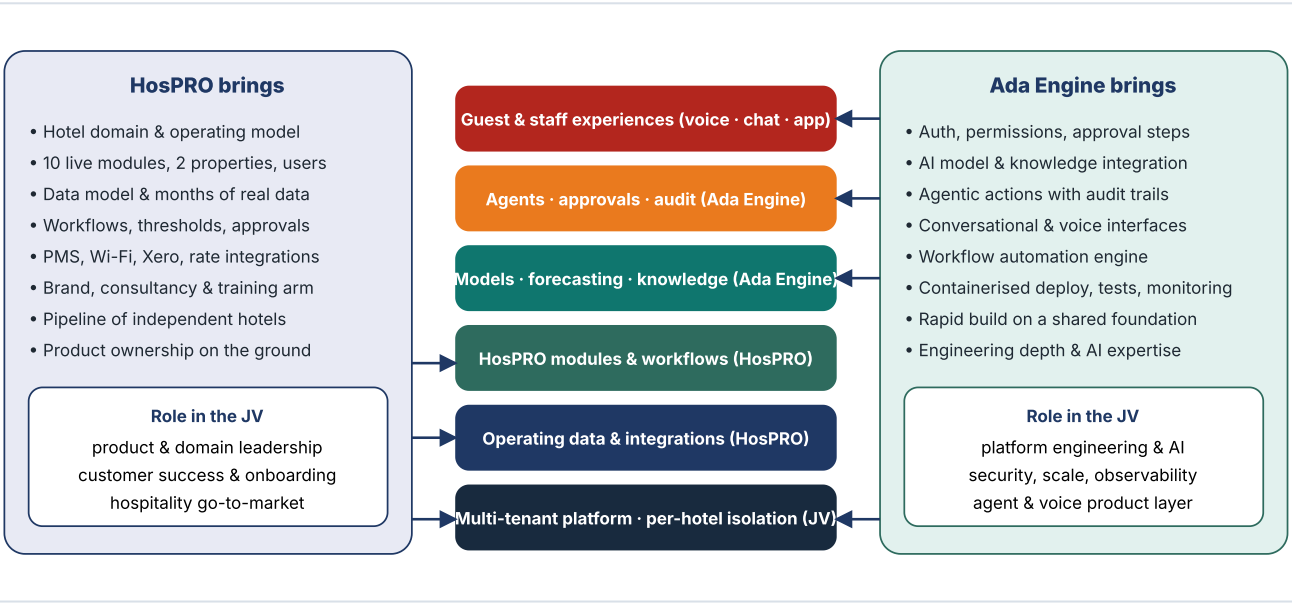

Figure 13 · Who brings what — the combined stack from operating data to guest-facing voice

Months 1–2 · Prove

Re-platform the HosFIX and HosHOUSE modules on the partner foundation with real auth and roles; ship fault triage, smart allocation and the drafted morning brief at Brandon Hall and The Barn. Measure against the business-case model.

Months 3–4 · Earn

HosREV on live feeds with forecasting and explanations; AI enquiry agent and instant quotes; guest concierge by message; compliance guardian. Three pilot independents live alongside the two reference hotels.

Months 5–6 · Scale

Multi-tenant onboarding in a day; guard-railed pricing autopilot and channel push; voice concierge; partner channel through consultancies and groups; ten hotels signed at launch.

Six-month roadmap: from two hotels to a product

Six months, three gates. Month 1–2 proves the partner platform on live operations; months 3–4 ship the revenue and sales intelligence that hotels pay most for; months 5–6 make it a product any independent can switch on. Every month ends with something measurable in a real hotel.

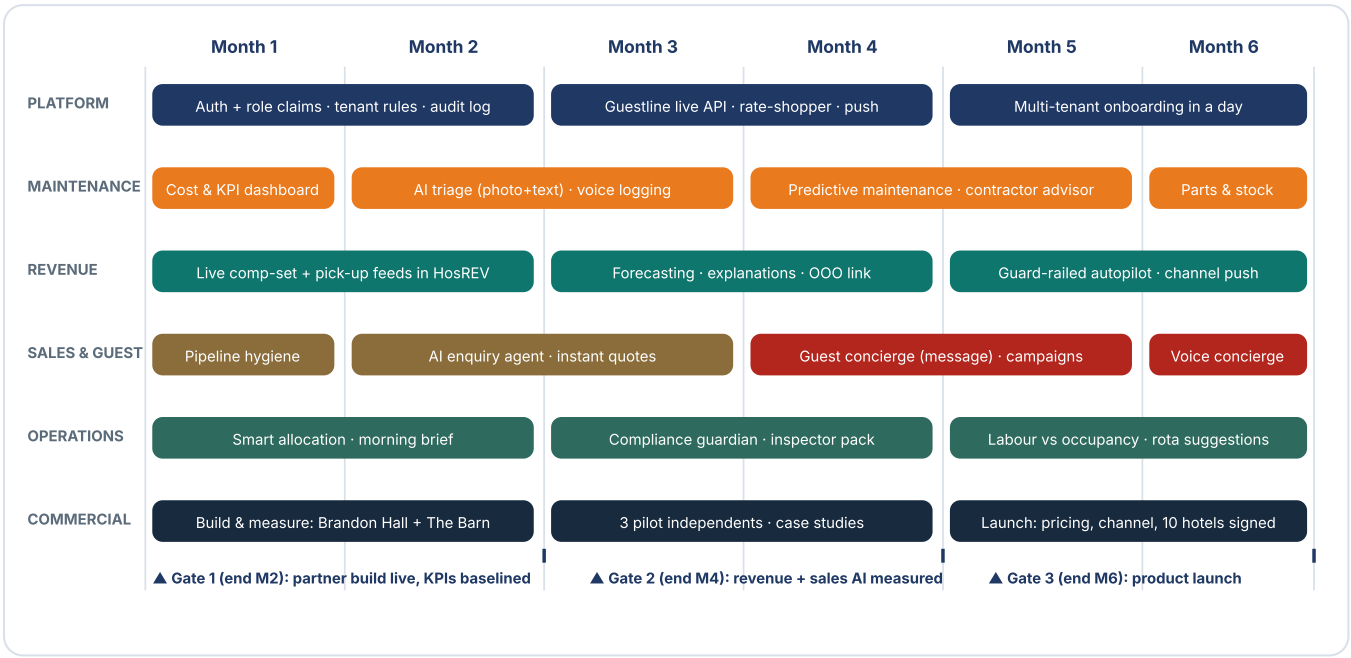

Figure I · Six tracks, three gates — every month ends with something live in a real hotel

Months 1–2 · Prove

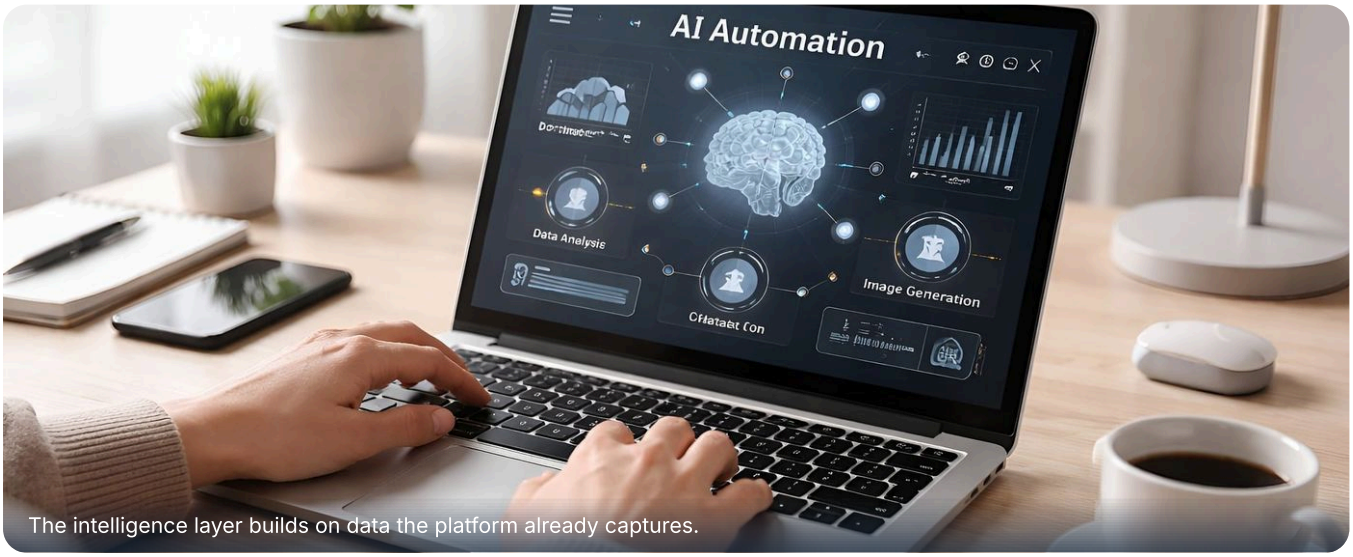

Partner platform under the live HosFIX and HosHOUSE modules; real auth; KPI baselines captured; first AI features (triage, allocation, brief) in daily use at two hotels. Success = fixer and housekeeper adoption unchanged, response times down.

Months 3–4 · Earn

HosREV on live feeds with forecasting and explanations; AI enquiry agent answering in minutes; concierge by message. Success = measured RevPAR, enquiry response time and conversion against the baseline; three further independents piloting.

Months 5–6 · Scale

Multi-tenant onboarding in a day; guard-railed pricing autopilot; parts, labour and voice features; pricing and channel agreed; ten hotels signed. Success = a product a consultancy or group can roll out without us in the room.

The intelligence layer builds on data the platform already captures.

Market, pricing and the shape of the joint venture

Market

Thousands of UK independent hotels, inns, spa hotels and wedding venues sit between 20 and 200 rooms, most running a PMS plus WhatsApp. The buyer's guide segments them as boutiques and independents (20–100 rooms, high-touch, medium complexity) and mid-size properties with departmental silos — precisely where HosPRO is already proven. Groups of three to twenty properties and hotel consultancies are a natural channel, and the model travels to Europe and the Gulf, where the same owner-operator pattern dominates.

Pricing model (proposed)

Per-property subscription by room band with the operating modules bundled; an intelligence tier (HosREV autopilot, agents, concierge) on top; onboarding and consultancy delivered by HosPRO. Comparable AI pricing tools alone charge independents a per-property subscription and show double-digit revenue uplifts; HosPRO bundles that with the operations layer. A 120-room hotel paying a few hundred pounds a month against a six-figure annual benefit is an easy conversation.

Unit economics to prove in the pilot

- Onboarding cost per property (target: one day, one person)
- Hosting cost per property (today: tens of pounds a month)
- Measured benefit per property across the seven levers
- Payback period (target: under three months)

What we are asking of a partner

- Engineering ownership of the platform layer: auth, multi-tenancy, deployment, observability.
- AI and agent capability: models, forecasting, triage, voice, with human approval built in.
- A joint product roadmap and shared IP in the intelligence layer; HosPRO retains the hospitality domain, brand and customer relationships.
- A commercial structure that rewards both parties on recurring revenue per property.

What we commit

- Two live properties as build-and-measure sites from day one.
- Full access to the current codebase, data model and operating workflows.
- Product, domain and go-to-market leadership; onboarding and training delivery.
- A pipeline of independent hotels through our consultancy and group relationships.

Governance

Monthly steering (product, engineering, commercial); gates at months 2, 4 and 6 with pre-agreed measures; decisions on IP, pricing and channel taken jointly; hotel data remains each hotel's, under HosPRO's existing privacy terms.

19 · NEXT STEPS

In short — and what happens next

> *HosPRO is the rare thing in hospitality technology: a connected operating platform that already runs real hotels, built on common sense by the people who run them. Add a serious AI and engineering partner and it becomes the operating system for the independent-hotel market.*

Why now

- The hard part — adoption on the floor — is done and proven in two properties.
- The data a model needs is already being captured every hour of every day.
- PMS access (Guestline) is agreed; rate and channel feeds are next.
- Independent hotels are under margin pressure and ready for tools priced for them.
- Agent and voice technology has matured to the point where "approve with one tap" is realistic, not a demo.

Proposed first conversation

1. Walk-through of the live platform at Brandon Hall (on site or screen-share) and a look at the data model.
2. Partner review of the codebase and the Ada Engine fit; agree the months 1–2 scope (fault triage, allocation, morning brief, auth).
3. Outline JV terms: roles, IP in the intelligence layer, revenue share per property, governance.
4. Build-and-measure at Brandon Hall and The Barn for 90 days against the business-case model.
5. Decide, publish the case studies and open the pipeline.

The platform at a glance

Operations
HosHOUSE · HosFIX · HosREC / HosDESK · F&B · HosFIRE · HosPEOPLE

Commercial
